1 Introduction

This note describes how to set up AudioCodes Enterprise Session Border Controller (referred to in this document as *E-SBC*) for interworking between Bell Canada's SIP Trunk and Microsoft's Lync Server 2013 environment.

1.1 Intended Audience

The document is intended for engineers, or AudioCodes and Bell Canada Partners, who are responsible for installing and configuring Bell Canada's SIP Trunk and Microsoft's Lync Server 2013 for enabling VoIP calls using AudioCodes E-SBC.

1.2 About AudioCodes E-SBC Product Series

AudioCodes' family of E-SBC devices enables reliable connectivity and security between the enterprise's and the service provider's VoIP networks.

The E-SBC provides perimeter defense as a way of protecting enterprises from malicious VoIP attacks; mediation for allowing the connection of any PBX and/or IP PBX to any service provider; and Service Assurance for service quality and manageability.

Designed as a cost-effective appliance, the E-SBC is based on field-proven VoIP and network services with a native host processor, allowing the creation of purpose-built multiservice appliances, providing smooth connectivity to cloud services, with integrated quality of service, SLA monitoring, security and manageability. The native implementation of SBC provides a host of additional capabilities that are not possible with standalone SBC appliances, such as VoIP mediation, PSTN access survivability, and third-party value-added services applications. This enables enterprises to utilize the advantages of converged networks and eliminate the need for standalone appliances.

AudioCodes' E-SBC is available as an integrated solution running on top of its field-proven Mediant Media Gateway and Multi-Service Business Router (MSBR) platforms, or as a software-only solution for deployment with third-party hardware.

This page is intentionally left blank.

2 Component Information

2.1 AudioCodes E-SBC Version

Table 2-1: AudioCodes E-SBC Version

SBC Vendor	AudioCodes
Models	▪ Mediant 500 E-SBC ▪ Mediant 800 Gateway & E-SBC ▪ Mediant 1000B Gateway & E-SBC ▪ Mediant 2600 E-SBC ▪ Mediant 3000 Gateway & E-SBC ▪ Mediant 4000 SBC
Software Version	SIP_6.80A.256
Protocol	▪ SIP/UDP (to the Bell Canada SIP Trunk) ▪ SIP/TCP or TLS (to the Lync FE Server)
Additional Notes	None

2.2 Bell Canada SIP Trunking Version

Table 2-2: Bell Canada Version

Vendor/Service Provider	Bell Canada
SSW Model/Service	BroadSoft
Software Version	
Protocol	SIP
Additional Notes	None

2.3 Microsoft Lync Server 2013 Version

Table 2-3: Microsoft Lync Server 2013 Version

Vendor	Microsoft
Model	Microsoft Lync
Software Version	Release 2013 5.0.8308.0
Protocol	SIP
Additional Notes	None

2.4 Interoperability Test Topology

Interoperability testing between AudioCodes' E-SBC and Bell Canada's SIP Trunk with Lync 2013 was performed using this topology:

- The enterprise deployed Microsoft Lync Server 2013 in its private network for enhanced communication within the enterprise.
- The enterprise wants to offer its employees enterprise-voice capabilities and to connect the enterprise to the PSTN network using Bell Canada's SIP Trunking service.
- AudioCodes E-SBC is implemented to interconnect between the enterprise LAN and the SIP Trunk.
 - Session: Real-time voice session using IP-based Session Initiation Protocol (SIP)
 - Border: IP-to-IP network border between the Lync Server 2013 network in the enterprise LAN, and Bell Canada's SIP Trunk located in the public network

Figure 2-1 illustrates this interoperability test topology:

Figure 2-1: Interoperability Test Topology between E-SBC and Microsoft Lync with Bell Canada's SIP Trunk

2.4.1 Environment Setup

The interoperability test topology includes the following environment setup:

Table 2-4: Environment Setup

Area	Setup
Network	- Microsoft Lync Server 2013 environment is located on the enterprise's LAN - Bell Canada's SIP Trunk is located on the WAN
Signaling Transcoding	- Microsoft Lync Server 2013 operates with SIP-over-TLS transport type - Bell Canada's SIP Trunk operates with SIP-over-UDP transport type
Codecs Transcoding	- Microsoft Lync Server 2013 supports G.711A-law and G.711U-law coders - Bell Canada's SIP Trunk supports G.711A-law, G.711U-law, and G.729 coder
Media Transcoding	- Microsoft Lync Server 2013 operates with SRTP media type - Bell Canada's SIP Trunk operates with RTP media type

2.4.2 Known Limitations

The following limitation was observed in the Interoperability tests performed for AudioCodes' E-SBC interworking between Microsoft Lync Server 2013 and Bell Canada's SIP Trunk:

1. If, following a "603 Decline", an Error Response is sent from the Lync server, Bell Canada's SIP Trunk continues to send re-INVITES and does not disconnect the call. To resolve this and disconnect the call correctly, a message manipulation rule is used to replace the Error Response with a "486 Busy Here" (see Section 4.13 on page 71).
2. In all outgoing calls (Lync to PSTN), Bell Canada's SIP Trunk waits for RTP packets in order to ring a 'Ring Back Tone'. Lync does not send these packets because it does not recognize comfort noise as an RTP stream. To resolve this issue, the force transcoding feature must be enabled in the E-SBC's Bell Canada IP Profile (see the 'Transcoding Mode' parameter under Section 4.6 on page 46).
3. In a Park Call scenario, when Lync transfers a call to the parking lot (puts the call on park), two INVITES are sent, the first with a=inactive and another after that with a=sendonly. The second Invite is responded to by Bell Canada with a=inactive instead of a=recvnonly. This causes a situation in which the parked party is on hold without hearing anything (Lync usually sends Music on Hold to the parked party). The main functionality is not impacted.

This page is intentionally left blank.

3 Configuring Lync Server 2013

This section shows how to configure Microsoft Lync Server 2013 to operate with AudioCodes' E-SBC.

Note: Dial plans, voice policies, and PSTN usages are also necessary for enterprise voice deployment but they're beyond the scope of this document.

3.1 Configuring the E-SBC as an IP / PSTN Gateway

The procedure below shows how to configure the E-SBC as an IP / PSTN Gateway.

➤ **To configure E-SBC as IP/PSTN Gateway and associate it with Mediation Server:**

1. On the server where the Topology Builder is installed, start the Lync Server 2013 Topology Builder (Windows **Start** menu > **All Programs** > **Lync Server Topology Builder**), as shown below:

Figure 3-1: Starting the Lync Server Topology Builder

The following is displayed:

Figure 3-2: Topology Builder

2. Select the **Download Topology from existing deployment** option, and then click **OK**; you're prompted to save the downloaded Topology:

Figure 3-3: Save Topology

- Enter a name for the Topology file, and then click **Save**. This step enables you to roll back from any changes you make during the installation.

The Topology Builder screen with the downloaded Topology is displayed:

Figure 3-4: Downloaded Topology

- Under the **Shared Components** node, right-click the **PSTN gateways** node, and then from the shortcut menu, choose **New IP/PSTN Gateway**, as shown below:

Figure 3-5: Choosing New IP/PSTN Gateway

The following is displayed:

Figure 3-6: Define the PSTN Gateway FQDN

The screenshot shows a window titled "Define New IP/PSTN Gateway" with a sub-header "Define the PSTN Gateway FQDN". Below the sub-header is a text box labeled "FQDN: *" containing the text "ITSP-GW.ilync15.local". At the bottom of the window are three buttons: "Help", "Back", and "Next", and a "Cancel" button.

5. Enter the Fully Qualified Domain Name (FQDN) of the E-SBC (e.g., **ITSP-GW.ilync15.local**). Update this FQDN in the relevant DNS record, and then click **Next**; the following is displayed:

Figure 3-7: Define the IP Address

The screenshot shows a window titled "Define New IP/PSTN Gateway" with a sub-header "Define the IP address". Below the sub-header are two radio button options: "Enable IPv4" and "Enable IPv6". Each option has two sub-options: "Use all configured IP addresses." and "Limit service usage to selected IP addresses.". Below each sub-option is a text box labeled "PSTN IP address:". At the bottom of the window are three buttons: "Help", "Back", and "Next", and a "Cancel" button.

6. Define the listening mode (IPv4 or IPv6) of the IP address of your new PSTN gateway, and then click **Next**.

7. Define a *root trunk* for the PSTN gateway. A trunk is a logical connection between the Mediation Server and a gateway uniquely identified by the following combination: Mediation Server FQDN, Mediation Server listening port (TLS or TCP), gateway IP and FQDN, and gateway listening port.

Notes:

- When defining a PSTN gateway in Topology Builder, you must define a root trunk to successfully add the PSTN gateway to your topology.
- The root trunk cannot be removed until the associated PSTN gateway is removed.

Figure 3-8: Define the Root Trunk

- a. In the 'Listening Port for IP/PSTN Gateway' field, enter the listening port that the E-SBC will use for SIP messages from the Mediation Server that will be associated with the root trunk of the PSTN gateway (e.g., **5067**).
- b. In the 'SIP Transport Protocol' field, select the transport type (e.g., **TLS**) that the trunk uses.
- c. In the 'Associated Mediation Server' field, select the Mediation Server pool to associate with the root trunk of this PSTN gateway.
- d. In the 'Associated Mediation Server Port' field, enter the listening port that the Mediation Server will use for SIP messages from the SBC (e.g., **5067**).
- e. Click **Finish**.

The E-SBC is added as a PSTN gateway, and a trunk is created as shown below:

Figure 3-9: E-SBC added as IP/PSTN Gateway and Trunk Created

8. Publish the Topology: In the main tree, select the root node **Lync Server**, and then from the **Action** menu, choose **Publish Topology**, as shown below:

Figure 3-10: Choosing Publish Topology

The following is displayed:

Figure 3-11: Publish the Topology

9. Click **Next**; the Topology Builder starts to publish your topology, as shown below:

Figure 3-12: Publishing in Progress

10. Wait until the publishing topology process completes successfully, as shown below:

Figure 3-13: Publishing Wizard Complete

11. Click **Finish**.

3.2 Configuring the "Route" on Lync Server 2013

This section shows how to configure a "Route" on the Lync Server 2013, and to associate it with the E-SBC PSTN gateway.

➤ **To configure the "route" on Lync Server 2013:**

1. Start the Microsoft Lync Server 2013 Control Panel (**Start > All Programs > Microsoft Lync Server 2013 > Lync Server Control Panel**), as shown below:

Figure 3-14: Opening the Lync Server Control Panel

You're prompted to enter your login credentials:

Figure 3-15: Lync Server Credentials

2. Enter your domain username and password, and then click **OK**; the Microsoft Lync Server 2013 Control Panel is displayed:

Figure 3-16: Microsoft Lync Server 2013 Control Panel

3. In the left navigation pane, select **Voice Routing**.

Figure 3-17: Voice Routing Page

4. In the Voice Routing page, select the **Route** tab.

Figure 3-18: Route Tab

5. Click **New**; the New Voice Route page appears:

Figure 3-19: Adding New Voice Route

New Voice Route

OK Cancel

Name:*

SIP Trunk Route

Description:

Build a Pattern to Match

Add the starting digits that you want this route to handle, or create the expression manually by clicking Edit.

Starting digits for numbers that you want to allow:

*

Add

Edit Reset ?

Suppress caller ID

Alternate caller ID:

Associated trunks:

Add...

Remove

8. Associate the route with the E-SBC Trunk that you created:
 - a. Under the 'Associated Trunks' group, click **Add**; a list of all the deployed gateways is displayed:

Figure 3-21: List of Deployed Trunks

- b. Select the E-SBC Trunk you created, and then click **OK**; the trunk is added to the 'Associated Trunks' group list:

Figure 3-22: Selected E-SBC Trunk

9. Associate a PSTN Usage with this route:
 - a. Under the 'Associated PSTN Usages' group, click **Select** and then add the associated PSTN Usage.

Figure 3-23: Associating PSTN Usage to Route

10. Click **OK** (located on the top of the New Voice Route page); the New Voice Route (Uncommitted) is displayed:

Figure 3-24: Confirmation of New Voice Route

11. From the **Commit** drop-down list, choose **Commit all**, as shown below:

Figure 3-25: Committing Voice Routes

The Uncommitted Voice Configuration Settings page appears:

Figure 3-26: Uncommitted Voice Configuration Settings

12. Click **Commit**; a message is displayed confirming a successful voice routing configuration, as shown below:

Figure 3-27: Confirmation of Successful Voice Routing Configuration

13. Click **Close**; the new committed Route is displayed in the Voice Routing page, as shown below:

Figure 3-28: Voice Routing Screen Displaying Committed Routes

The screenshot shows the Microsoft Lync Server 2013 Control Panel interface. The left sidebar contains navigation links: Home, Users, Topology, IM and Presence, Persistent Chat, Voice Routing (highlighted), Voice Features, Response Groups, Conferencing, Clients, Federation and External Access, Monitoring and Archiving, Security, and Network Configuration. The main content area is titled 'Lync Server 2013' and includes a top navigation bar with tabs: Dial Plan, Voice Policy, Route (selected), PSTN Usage, Trunk Configuration, and Test Voice Routing. Below the tabs is a search bar and a 'Create voice routing test case information' link. The main area displays a table of committed routes with columns: Name, State, PSTN usage, and Pattern to match. The table lists five routes: LocalRoute, SBA001, COLT, and SIP Trunk Route, all with a 'Committed' state and 'Internal, Local, Long Distance' PSTN usage. A 'New' button and 'Edit', 'Move up', 'Move down', 'Action', and 'Commit' dropdowns are visible above the table.

Name	State	PSTN usage	Pattern to match
LocalRoute	Committed	Internal, Local, Long Distance	^\+1[0-9]{10}\$
SBA001	Committed	Internal, Local, Long Distance	^\+972355555
COLT	Committed	Internal, Local, Long Distance	^\+00972
SIP Trunk Route	Committed	Internal, Local, Long Distance	.*

14. For ITSPs that implement a call identifier, continue with the following steps:

Note: The SIP History-Info header provides a method to verify the identity (ID) of the call forwarder (i.e., the Lync user number). This ID is required by Bell Canada's SIP Trunk in the P-Asserted-Identity header. Using a Message Manipulation rule (see Section 4.13 on page 71), the device adds this ID to the P-Asserted-Identity header in the sent INVITE message.

- a. In the Voice Routing page, select the **Trunk Configuration** tab. Note that you can add and modify trunk configuration by site or by pool.

Figure 3-29: Voice Routing Screen – Trunk Configuration Tab

- b. Click **Edit**; the Edit Trunk Configuration page appears:

- c. Select the **Enable forward call history** option, and then click **OK**.
 d. Repeat Steps 11 through 13 to commit your settings.

This page is intentionally left blank.

4 Configuring AudioCodes E-SBC

This section shows how to configure AudioCodes E-SBC for interworking between Microsoft Lync Server 2013 and the Bell Canada SIP Trunk. These configuration procedures are based on the interoperability test topology described in Section 2.4 on page 10, and include the following main areas:

- E-SBC WAN interface - Bell Canada SIP Trunking environment
- E-SBC LAN interface - Lync Server 2013 environment

Configuration is performed using the E-SBC's embedded Web server (referred to in this document as *Web interface*).

Notes:

- For implementing Microsoft Lync and Bell Canada's SIP Trunk based on the configuration described in this section, AudioCodes E-SBC must be installed with a Software License Key that includes the following software features:

- ✓ Microsoft
- ✓ SBC
- ✓ Security
- ✓ DSP
- ✓ RTP
- ✓ SIP

For more information about the Software License Key, contact your AudioCodes sales representative.

- The scope of this document does **not** cover security aspects for connecting the SIP Trunk to the Microsoft Lync environment. Security measures should be implemented in accordance with your organization's security policies. For basic security guidelines, refer to the *Recommended Security Guidelines* document.
- Before you begin configuring the E-SBC, make sure that the E-SBC's Web interface navigation tree is in **Advanced** display mode. To do this, select the **Advanced** option, as shown below:

Note that when the E-SBC is reset, the navigation tree reverts to **Basic** display mode.

4.1 Step 1: Configure IP Network Interfaces

This step shows how to configure the E-SBC's IP network interfaces. There are several methods of deploying the E-SBC but the interoperability test topology employs this method:

- E-SBC interfaces with the following IP entities:
 - Lync servers, located on the LAN
 - Bell Canada SIP Trunk, located on the WAN
- E-SBC connects to the WAN through a DMZ network
- Physical connection: The type of physical connection to the LAN depends on the method used to connect to the enterprise's network. In the interoperability test topology, E-SBC connects to the LAN and WAN using dedicated LAN ports (i.e., two ports and two network cables are used).
- E-SBC also uses two logical network interfaces:
 - LAN (VLAN ID 1)
 - WAN (VLAN ID 2)

Figure 4-1: Network Interfaces in Interoperability Test Topology

4.1.1 Step 1a: Configure VLANs

This step shows how to define VLANs for each of the following interfaces:

- LAN VoIP (assigned the name "Voice")
- WAN VoIP (assigned the name "WANSP")

➤ **To configure the VLANs:**

1. Open the Ethernet Device Table page (**Configuration** tab > **VoIP** menu > **Network** > **Ethernet Device Table**).
2. There will be one existing row for VLAN ID 1 and an underlying interface GROUP_1.
3. Add another VLAN ID 2 for the WAN side as follows:

Parameter	Value
Index	1
VLAN ID	2
Underlying Interface	GROUP_2 (Ethernet port group)
Name	vlan 2

Figure 4-2: Configured VLAN IDs in Ethernet Device Table

Ethernet Device Table			
Add +			
Index	VLAN ID	Underlying Interface	Name
0	1	GROUP_1	vlan 1
1	2	GROUP_2	vlan 2

Page 1 of 1 Show 10 records per page View 1 - 2 of 2

4.1.2 Step 1b: Configure Network Interfaces

This step shows how to configure the IP network interfaces for each of the following interfaces:

- LAN VoIP (assigned the name "Voice")
- WAN VoIP (assigned the name "WANSP")

➤ **To configure the IP network interfaces:**

1. Open the IP Interfaces Table page (**Configuration** tab > **VoIP** menu > **Network** > **IP Interfaces Table**).
2. Modify the existing LAN network interface:
 - a. Select the 'Index' radio button of the **OAMP + Media + Control** table row, and then click **Edit**.

- b. Configure the interface as follows:

Parameter	Value
IP Address	10.15.45.101 (E-SBC IP address)
Prefix Length	16 (subnet mask in bits for 255.255.0.0)
Gateway	10.15.0.1
VLAN ID	1
Interface Name	Voice (arbitrary descriptive name)
Primary DNS Server IP Address	10.15.25.1
Underlying Device	vlan 1

3. Add a network interface for the WAN side:

- a. Enter **1**, and then click **Add Index**.

- b. Configure the interface as follows:

Parameter	Value
Application Type	Media + Control
IP Address	195.189.192.156 (WAN IP address)
Prefix Length	25 (for 255.255.255.128)
Gateway	195.189.192.129 (router's IP address)
VLAN ID	2
Interface Name	WANSP
Primary DNS Server IP Address	80.179.52.100
Secondary DNS Server IP Address	80.179.55.100
Underlying Device	vlan 2

4. Click **Apply**, and then **Done**.

Figure 4-3 shows the configured IP network interfaces:

Figure 4-3: Configured Network Interfaces in IP Interfaces Table

Interface Table									
Add +									
Index	Application Type	Interface Mode	IP Address	Prefix Length	Default Gateway	Interface Name	Primary DNS	Secondary DNS	Under Device
0	OAMP + Media	IPv4 Manual	10.15.17.55	16	10.15.0.1	Voice	10.15.25.1	0.0.0.0	vlan 1
1	Media + Control	IPv4 Manual	195.189.192.160	25	195.189.192.129	WANSP	80.179.52.100	80.179.55.100	vlan 2

Page 1 of 1 Show 10 records per page View 1 - 2 of 2

4.1.3 Step 1c: Configure the Native VLAN ID

This step shows how to configure the Native VLAN ID for the LAN and WAN interfaces.

➤ **To configure the Native VLAN ID for the IP network interfaces:**

1. Open the Physical Ports Settings page (**Configuration** tab > **VoIP** menu > **Network** > **Physical Ports Table**).
2. For the **GROUP_1** member ports, set the 'Native Vlan' field to **1**. This VLAN was assigned to network interface "Voice".
3. For the **GROUP_2** member ports, set the 'Native Vlan' field to **2**. This VLAN was assigned to network interface "WANSP".

Figure 4-4: Configured Port Native VLAN

Physical Ports Settings							
Index	Port	Mode	Native Vlan	Speed&Duplex	Description	Group Member	Group Status
0	GE_4_1	Enable	1	Auto Negotiation	User Port #0	GROUP_1	Active
1	GE_4_2	Enable	1	Auto Negotiation	User Port #1	GROUP_1	Redundant
2	GE_4_3	Enable	2	Auto Negotiation	User Port #2	GROUP_2	Active
3	GE_4_4	Enable	2	Auto Negotiation	User Port #3	GROUP_2	Redundant

4.2 Step 2: Enable the SBC Application

This step shows how to enable the SBC application.

➤ **To enable the SBC application:**

1. Open the Applications Enabling page (**Configuration** tab > **VoIP** menu > **Applications Enabling** > **Applications Enabling**).

Figure 4-5: Enabling SBC Application

⚡ SAS Application	Disable
⚡ SBC Application	Enable
⚡ IP to IP Application	Disable

2. From the 'SBC Application' drop-down list, select **Enable**.
3. Click **Submit**.
4. Reset the E-SBC with a burn to flash for this setting to take effect (see Section 4.16 on page 87).

4.3 Step 3: Configure Signaling Routing Domains

This step shows how to configure Signaling Routing Domains (SRD). The SRD represents a logical VoIP network. Each logical or physical connection requires an SRD, for example, if the E-SBC interfaces with both the LAN and WAN, a different SRD would be required for each.

The SRD comprises:

- Media Realm: defines a UDP port range for RTP/SRTP (media) traffic on a specific logical IP network interface of the E-SBC.
- SIP Interface: defines a listening port and type (UDP, TCP, or TLS) for SIP signaling traffic on a specific logical IP network interface of the E-SBC.

4.3.1 Step 3a: Configure Media Realms

This step shows how to configure Media Realms. The simplest configuration is to create two Media Realms - one for internal (LAN) traffic and the other for external (WAN) traffic.

➤ To configure Media Realms:

1. Open the Media Realm Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **Media Realm Table**).
2. Modify the existing Media Realm for LAN traffic:

Parameter	Value
Index	0
Media Realm Name	MRLan (descriptive name)
IPv4 Interface Name	Voice
Port Range Start	6000 (represents the lowest UDP port number used for media on the LAN)
Number of Media Session Legs	10 (media sessions assigned with port range)

Figure 4-6: Configuring Media Realm for LAN

Edit Record #0	
Index	0
Media Realm Name	MRLan
IPv4 Interface Name	Voice
IPv6 Interface Name	None
Port Range Start	6000
Number Of Media Session Legs	10
Port Range End	6090
Default Media Realm	Yes
QOE Profile	None
BW Profile	None

1	MRWan	WANSP	None
Page 1 of 1 Show 10 records per page View 1 - 2 of 2			

4.3.2 Step 3b: Configure SRDs

This step shows how to configure the SRDs.

➤ **To configure SRDs:**

1. Open the SRD Settings page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **SRD Table**).
2. Configure an SRD for the E-SBC's internal interface (toward Lync Server 2013):

Parameter	Value
SRD Index	1
SRD Name	SRDLan (descriptive name for SRD)
Media Realm	MRLan (associates SRD with Media Realm)

Figure 4-9: Configuring LAN SRD

Edit Record #1	
Index	1
Name	SRDLan
Media Realm Name	MRLan
Media Anchoring	Enable
Block Unregistered Users	NO
Max. Number of Registered Users	-1
Enable Un-Authenticated Registrations	Enable
Submit Cancel	

3. Configure an SRD for the E-SBC's external interface (toward Bell Canada's SIP Trunk):

Parameter	Value
SRD Index	2
SRD Name	SRDWan
Media Realm	MRWan

Figure 4-10: Configuring WAN SRD

Edit Record #2	
Index	5
Name	SRDWan
Media Realm Name	MRWan
Media Anchoring	Enable
Block Unregistered Users	NO
Max. Number of Registered Users	-1
Enable Un-Authenticated Registrations	Enable
Submit Cancel	

Figure 4-11 shows the configured SRDs:

Figure 4-11: Configured SRDs in SRD Table

Add +			
Index	Name	Media Realm Name	Media Anchoring
1	SRDLan	MRLan	Enable
2	SRDWan	MRWan	Enable
Page 1 of 1 Show 10 records per page View 1 - 2 of 2			

4.3.3 Step 3c: Configure SIP Signaling Interfaces

This step shows how to configure SIP Interfaces. For the interoperability test topology, an internal and external SIP Interface must be configured for the E-SBC.

➤ **To configure SIP Interfaces:**

1. Open the SIP Interface Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **SIP Interface Table**).
2. Configure a SIP interface for the LAN:

Parameter	Value
Index	1
Interface Name	Lync (arbitrary descriptive name)
Network Interface	Voice
Application Type	SBC
TLS Port	5067
TCP and UDP	0
SRD	1

3. Configure a SIP interface for the WAN:

Parameter	Value
Index	2
Interface Name	BellCanada (arbitrary descriptive name)
Network Interface	WANSP
Application Type	SBC
UDP Port	5060
TCP and TLS	0
SRD	2

Figure 4-12 shows the configured SIP Interfaces:

Figure 4-12: Configured SIP Interfaces in SIP Interface Table

Index	SIP Interface Name	Network Interface	Application Type	UDP Port	TCP Port	TLS Port	SRD
1	Lync	Voice	SBC	0	0	5067	1
2	BellCanada	WANSP	SBC	5060	0	0	2

4.4 Step 4: Configure Proxy Sets

This step shows how to configure Proxy Sets. The Proxy Set defines the destination address (IP address or FQDN) of the IP entity server. Proxy Sets can also be used to configure load balancing between multiple servers.

For the interoperability test topology, two Proxy Sets need to be configured for the following IP entities:

- Microsoft Lync Server 2013
- Bell Canada's SIP Trunk

These Proxy Sets will later be associated with IP Groups.

➤ **To configure Proxy Sets:**

1. Open the Proxy Sets Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **Proxy Sets Table**).
2. Configure a Proxy Set for Lync Server 2013:

Parameter	Value
Proxy Set ID	1
Proxy Address	FE15.ilync15.local:5067 (Lync Server 2013 IP address / FQDN and destination port)
Transport Type	TLS
Proxy Name	Lync (arbitrary descriptive name)
Enable Proxy Keep Alive	Using Options
Proxy Load Balancing Method	Round Robin
Is Proxy Hot Swap	Yes
Proxy Redundancy Mode	Homing
SRD Index	1

Figure 4-13: Configuring Proxy Set for Microsoft Lync Server 2013

TLS Context Index	-1

4. Reset the E-SBC with a burn to flash for these settings to take effect (see Section 4.16 on page 87).

4.5 Step 5: Configure IP Groups

This step shows how to configure IP Groups. The IP Group represents an IP entity on the network with which the E-SBC communicates. This can be a server (e.g., IP PBX or ITSP) or it can be a group of users (e.g., LAN IP phones). For servers, the IP Group is typically used to define the server's IP address by associating it with a Proxy Set. A typical deployment consists of multiple IP Groups associated with the same SRD. For example, you can have two LAN IP PBXs sharing the same SRD, and two ITSPs / SIP Trunks sharing the same SRD. Once IP Groups are configured, they are used to configure IP-to-IP routing rules for denoting source and destination of the call.

In the interoperability test topology, IP Groups must be configured for the following IP entities:

- Lync Server 2013 (Mediation Server) located on LAN
- Bell Canada's SIP Trunk located on WAN

➤ To configure IP Groups:

1. Open the IP Group Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **IP Group Table**).
2. Configure an IP Group for the Lync Server 2013 Mediation Server:

Parameter	Value
Index	1
Type	Server
Description	Lync (arbitrary descriptive name)
Proxy Set ID	1
SIP Group Name	cust5-tor.vsac.bell.ca (according to ITSP requirement)
SRD	1
Media Realm Name	MRLan
IP Profile ID	1

3. Configure an IP Group for Bell Canada's SIP Trunk:

Parameter	Value
Index	2
Type	Server
Description	BellCanada (arbitrary descriptive name)
Proxy Set ID	2
SIP Group Name	siptrunking.bell.ca (according to ITSP requirement)
SRD	2
Media Realm Name	MRWan
IP Profile ID	2
Classify By Proxy Set	Disable (For Load Balancing configuration only. Classification is done according to the Classification Table; see Section 4.15.1 on page 83)

The figure below shows the configured IP Groups:

Figure 4-15: Configured IP Groups in IP Group Table

▼ IP Group Table									
Add +									
Index	Type	Description	Proxy Set ID	SIP Group Name	Contact User	SIP Re-Routing Mode	Always Use Route Table	SRD	
1	Server	Lync	1	cust5-tor.vsac.bell.ca			No	1	
2	Server	BellCanada	2	siptrunking.bell.ca			No	2	
Page 1 of 1 Show 10 records per page View 1 - 2 of 2									

4.6 Step 6: Configure IP Profiles

This step shows how to configure IP Profiles. The IP Profile defines a set of call capabilities relating to signaling (e.g., SIP message terminations such as REFER) and media (e.g., coder and transcoding method).

In the interoperability test topology, IP Profiles must be configured for the following IP entities:

- Microsoft Lync Server 2013 - to operate in secure mode using SRTP and TLS
- Bell Canada's SIP Trunk - to operate in non-secure mode using RTP and UDP

Note that the IP Profiles were assigned to these entities (i.e., IP Groups) in the previous step (see Section 4.5 on page 44).

➤ To configure IP Profiles:

1. Open the IP Profile Settings page (**Configuration** tab > **VoIP** > **Coders and Profiles** > **IP Profile Settings**).
2. Click **Add**.
3. Click the **Common** tab, and then configure the parameters as follows:

Parameter	Value
Index	1
Profile Name	Lync (arbitrary descriptive name)
Symmetric MKI	Enable
MKI Size	1
Reset SRTP State Upon Re-key	Enable
Generate SRTP keys mode:	Always

Figure 4-16: Configuring IP Profile for Lync Server 2013 – Common Tab

Parameter	Value
Index	1
Profile Name	Lync
Profile Preference	1
Dynamic Jitter Buffer Minimum Delay [msec]	10
Dynamic Jitter Buffer Optimization Factor	10
RTP IP DiffServ	46
Signaling DiffServ	40
Silence Suppression	Disable
RTP Redundancy Depth	0
Echo Canceler	Line
Disconnect on Broken Connection	Yes
Input Gain (-32 to 31 dB)	0
Voice Volume (-32 to 31 dB)	0
Media IP Version Preference	Only IPv4
Symmetric MKI	Enable
MKI Size	1
Reset SRTP Upon Re-key	Enable
Generate SRTP keys mode	Always
Jitter Buffer Max Delay [msec]	300

4. Click the **SBC** tab, and then configure the parameters as follows:

Parameter	Value
Extension Coders Group ID	Coders Group 1
Allowed Coders Group ID	Coders Group 1
Allowed Coders Mode	Restriction (only Allowed Coders will be introduced in SDP offer)
Media Security Behavior	SRTP
Session Expires Mode	Supported (required because Bell Canada's SIP Trunk does not support Session Timer, so SBC should negotiate it with Lync)
Remote Update Support	Supported Only After Connect
Remote Re-Invite Support	Supported Only With SDP
Remote Delayed Offer Support	Not Supported
Remote Refer Behavior	Handle Locally (required because Lync Server 2013 does not support receipt of SIP REFER)

Parameter	Value
Remote 3xx Behavior	Handle Locally (required because Lync Server 2013 does not support receipt of SIP 3xx responses)
Enforce MKI Size	Enforce
Remote Early Media RTP Behavior	Delayed (required because Lync Server 2013 does not send an RTP immediately to the remote side when it sends a SIP 18x response)
Remote Hold Format	Inactive (required because Bell Canada's SIP Trunk sends 0.0.0.0 for Hold but Lync Server 2013 does not recognize that format)

Figure 4-17: Configuring IP Profile for Lync Server 2013 – SBC Tab

Common GW SBC	
Index	1
Extension Coders Group ID	Coders Group 1
Transcoding Mode	Only If Required

RTP Redundancy Behavior	AS IS
Play RBT To Transferee	No
RTCP Mode	Transparent
Jitter Compensation	Disable
Remote Renegotiate on Fax Detection	Don't Care

5. Configure an IP Profile for Bell Canada's SIP Trunk:
 - a. Click **Add**.
 - b. Click the **Common** tab, and then configure the parameters as follows:

Parameter	Value
Index	2
Profile Name	BellCanada (arbitrary descriptive name)

Figure 4-18: Configuring IP Profile for Bell Canada's SIP Trunk – Common Tab

Parameter	Value
Index	2
Profile Name	BellCanada
Profile Preference	1
Dynamic Jitter Buffer Minimum Delay [msec]	10
Dynamic Jitter Buffer Optimization Factor	10
RTP IP DiffServ	46
Signaling DiffServ	40
Silence Suppression	Disable
RTP Redundancy Depth	0
Echo Canceler	Line
Disconnect on Broken Connection	Yes
Input Gain (-32 to 31 dB)	0
Voice Volume (-32 to 31 dB)	0
Media IP Version Preference	Only IPv4
Symmetric MKI	Disable
MKI Size	0
Reset SRTP Upon Re-key	Disable
Generate SRTP keys mode	Only If Required
Jitter Buffer Max Delay [msec]	300

Submit Cancel

6. Click the **SBC** tab, and then configure the parameters as follows:

Parameter	Value
Profile ID	2
Extension Coders Group ID	Coders Group 2
Transcoding Mode	Force (required for fixing Ring Back Tone issue, mentioned under 'Known Limitations')
Allowed Coders Group ID	Coders Group 2
Allowed Coders Mode	Restriction and Preference (lists Allowed Coders first and then original coders in received SDP offer)
Media Security Behavior	RTP
P-Asserted-Identity	Add (required for anonymous calls)
Diversion Mode	Add (required for transferred calls)
History-Info Mode	Remove
SBC Session Expires Mode	Not Supported
Remote REFER Behavior	Handle Locally (E-SBC handles / terminates incoming REFER requests instead of forwarding them to the SIP Trunk)
Play RBT To Transferee	Yes

Figure 4-19: Configuring IP Profile for Bell Canada's SIP Trunk – SBC Tab

Common GW SBC	
Index	2
Extension Coders Group ID	Coders Group 2
Transcoding Mode	Force

Preferred PTime	0
Use Silence Suppression	Transparent
RTP Redundancy Behavior	AS IS
Play RBT To Transferee	Yes
RTCP Mode	Transparent
Jitter Compensation	Disable
Remote Renegotiate on Fax Detection	Don't Care

Submit Cancel

4.7 Step 7: Configure Coders

This step shows how to configure coders (termed *Coder Group*). As Lync Server 2013 supports the G.711 coder while the network connection to Bell Canada's SIP Trunk may restrict operation with a lower bandwidth coder such as G.729, you need to add a Coder Group with the G.729 coder for the Bell Canada SIP Trunk.

Note that the Coder Group ID for this entity was assigned to its corresponding IP Profile in the previous step (see Section 4.6 on page 46).

➤ **To configure coders:**

1. Open the Coder Group Settings (**Configuration** tab > **VoIP** menu > **Coders and Profiles** > **Coders Group Settings**).
2. Configure a Coder Group for Lync Server 2013:

Parameter	Value
Coder Group ID	1
Coder Name	▪ G.711 U-law ▪ G.711 A-law
Silence Suppression	Enable (for both coders)

Figure 4-20: Configuring Coder Group for Lync Server 2013

Coder Name	Packetization Time	Rate	Payload Type	Silence Suppression
G.711U-law	20	64	0	Enable
G.711A-law	20	64	8	Enable

3. Configure a Coder Group for Bell Canada's SIP Trunk:

Parameter	Value
Coder Group ID	2
Coder Name	G.729

Figure 4-21: Configuring Coder Group for Bell Canada's SIP Trunk

Coder Name	Packetization Time	Rate	Payload Type	Silence Suppression
G.729	20	8	18	Disabled

The procedure below describes how to configure an Allowed Coders Group to ensure that voice sent to the Bell Canada SIP Trunk uses the G.729 coder *whenever possible*. Note that this Allowed Coders Group ID was assigned to the IP Profile belonging to the Bell Canada SIP Trunk in the previous step (see Section 4.6 on page 46).

➤ **To set a preferred coders:**

1. Open the Allowed Coders Group page (**Configuration** tab > **VoIP** menu > **SBC** > **Allowed Coders Group**).
2. Configure an Allowed Coders for Lync as follows:

Parameter	Value
Allowed Coders Group ID	1
Coder Name	G.711A-law
Coder Name	G.711U-law

Figure 4-22: Configuring Allowed Coders Group for Lync

3. Configure an Allowed Coders for Bell Canada's SIP Trunk as follows:

Parameter	Value
Allowed Coders Group ID	2
Coder Name	G.729
Coder Name	G.711A-law
Coder Name	G.711U-law

Figure 4-23: Configuring Allowed Coders Group for Bell Canada's SIP Trunk

4. Open the General Settings page (**Configuration** tab > **VoIP** menu > **SBC** > **General Settings**).

Figure 4-24: SBC Preferences Mode

Transcoding Mode	Only If Required	▼
No Answer Timeout [sec]	600	
GRUU Mode	As Proxy	▼
Minimum Session-Expires [sec]	90	
BroadWorks Survivability Feature	Disable	▼

User Registration Grace Time [sec]	0	
Fax Detection Timeout [sec]	10	
Max Forwards Limit	10	
SBC Enable Subscribe Trying	Disable	▼
RTCP Mode	Transparent	▼

5. From the 'Preferences Mode' drop-down list, select **Include Extensions**.
6. Click **Submit**.

4.8 Step 8: Configure SIP TLS Connection

This section shows how to configure the E-SBC for using a TLS connection with the Lync Server 2013 Mediation Server. This is essential for a secure SIP TLS connection.

4.8.1 Step 8a: Configure the NTP Server Address

This step shows how to configure the NTP server's IP address. It is recommended to implement an NTP server (Microsoft NTP server or a third-party server) to ensure that the E-SBC receives the accurate and current date and time. This is necessary for validating certificates of remote parties.

➤ **To configure the NTP server address:**

1. Open the Application Settings page (**Configuration** tab > **System** > **Application Settings**).
2. In the 'NTP Server IP Address' field, enter the IP address of the NTP server (e.g., **10.15.25.1**).

Figure 4-25: Configuring NTP Server Address

▼ NTP Settings		
NTP Server Address (IP or FQDN)	10.15.25.1	
NTP UTC Offset	Hours: 3	Minutes: 0
NTP Updated Interval	Hours: 24	Minutes: 0
NTP Secondary Server Address (IP or FQDN)		
NTP Authentication Key Identifier	0	
NTP Authentication Secret Key		

3. Click **Submit**.

4.8.2 Step 8b: Configure a Certificate

This step shows how to exchange a certificate with Microsoft Certificate Authority (CA). The certificate is used by the E-SBC to authenticate the connection with Lync Server 2013.

The procedure involves the following main steps:

- a. Generating a Certificate Signing Request (CSR).
- b. Requesting Device Certificate from CA.
- c. Obtaining Trusted Root Certificate from CA.
- d. Deploying Device and Trusted Root Certificates on E-SBC.

➤ **To configure a certificate:**

1. Open the TLS Contexts page (**Configuration** tab > **System** menu > **TLS Contexts**).
2. In the TLS Contexts table, select the required TLS Context index row, and then click the **Context Certificates**  button, located at the bottom of the TLS Contexts page; the Context Certificates page appears.
3. Under the **Certificate Signing Request** group, do the following:
 - a. In the 'Subject Name [CN]' field, enter the E-SBC FQDN name (e.g., **ITSP-GW.ilync15.local**).
 - b. Fill in the rest of the request fields according to your security provider's instructions.
4. Click the **Create CSR** button; a textual certificate signing request is displayed in the area below the button:

Figure 4-26: Certificate Signing Request – Creating CSR

Certificate Signing Request	
Subject Name [CN]	ITSP-GW.ilync15.local
Organizational Unit [OU] (optional)	
Company name [O] (optional)	
Locality or city name [L] (optional)	
State [ST] (optional)	
Country code [C] (optional)	
Create CSR	
After creating the CSR, copy the text below (including the BEGIN/END lines) and send it to your Certification Authority for signing.	
<pre> -----BEGIN CERTIFICATE REQUEST----- MIIBXzCBYQIBADAgMR4wHAYDVQQDExVJVFNQLUdXLmlseW5jMTUubG9jYWVwZ8w DQYJKoZIhvcNAQEBBQADgY0AMIGJAoGBAKkobC9QmE0XA0vaTrkioo0LVrwNsC1 3TMgncMVxdp9/BCXyygT2W1vz0NGUssypa7w2DKKkxr8xA9sGLXwy0ZCyB49U1pDF DJV8IldUfT8qL9d9V64f3Z004I1hweZSn4hHdAfGy0S6e91JhFw/USUD6/bNygQz 52203jtjXKmdAgMBAAGgADANBgkqhkiG9w0BAQQFAAOBqQBLqe880JGrmEzPu5Q1 pRGiOuEQ4Pr6PL+JKghii6UpLmHEwixTedayzNh7b2yQqFYxiVWmX2JwrvXaCp5Y 8z8hOCZxV/E4MrR2s8bYb6bqxeteAXs+VwxgKObb4pSFfGLc82+dZUcODAB0w2Fv nxSEcPACKnZittF/GgW+A4AoMQ== -----END CERTIFICATE REQUEST----- </pre>	

Note: The value entered in this field must be identical to the gateway name configured in the Topology Builder for Lync Server 2013 (see Section 3.1 on page 13).

5. Copy the CSR from the line "----BEGIN CERTIFICATE" to "END CERTIFICATE REQUEST----" to a text file (such as Notepad), and then save it to a folder on your computer with the file name *certreq.txt*.

6. Open a Web browser and navigate to the Microsoft Certificates Services Web site at <http://<certificate server>/CertSrv>.

Figure 4-27: Microsoft Certificate Services Web Page

7. Click **Request a certificate**.

Private key pass-phrase (optional)

Send **Private Key** file from your computer to the device.
The file must be in either PEM or PFX (PKCS#12) format.

Note: Replacing the private key is not recommended but if it's done, it should be over a physically-secure network link.

Send **Device Certificate** file from your computer to the device.
The file must be in textual PEM format.

- b. In the E-SBC's Web interface, return to the **TLS Contexts** page.
- c. In the TLS Contexts table, select the required TLS Context index row, and then click the **TLS Context Trusted-Roots Certificates** button, located at the bottom of the TLS Contexts page; the Trusted Certificates page appears.
- d. Click the **Import** button, and then select the certificate file to load.

Figure 4-34: Importing Root Certificate into Trusted Certificates Store

Import New Certificate ✕

D:\backup\warehouse\c

21. Click **OK**; the certificate is loaded to the device and listed in the Trusted Certificates store.
22. Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.16 on page 87).

4.9 Step 9: Configure SRTP

This step shows how to configure media security. If you configure the Microsoft Mediation Server to use SRTP, you must configure the E-SBC to operate in the same manner. Note that SRTP was enabled for Lync Server 2013 when you configured an IP Profile for Lync Server 2013 (see Section 4.6 on page 46).

➤ **To configure media security:**

1. Open the Media Security page (**Configuration** tab > **Media** menu > **Media Security**).
2. Configure the parameters as follows:

Parameter	Value
Media Security	Enable

Figure 4-35: Configuring SRTP

General Media Security Settings	
Media Security	Enable
Aria Protocol Support	Disable
Media Security Behavior	Mandatory
Authentication On Transmitted RTP Packets	Active
Encryption On Transmitted RTP Packets	Active
Encryption On Transmitted RTCP Packets	Active
SRTP Tunneling Authentication for RTP	Disable
SRTP Tunneling Authentication for RTCP	Disable

3. Click **Submit**.
4. Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.16 on page 87).

4.10 Step 10: Configure Maximum IP Media Channels

This step shows how to configure the maximum number of required IP media channels. The number of media channels represents the number of DSP channels that the E-SBC allocates to call sessions.

Note: This step is required *only* if transcoding is required.

➤ **To configure the maximum number of IP media channels:**

1. Open the IP Media Settings page (**Configuration** tab > **VoIP** menu > **IP Media** > **IP Media Settings**).

Figure 4-36: Configuring Number of IP Media Channels

Number of Media Channels	30
Voice Streaming	Disable
NetAnn Announcement ID	annc
MSCML ID	ivr
Transcoding ID	trans

2. In the 'Number of Media Channels' field, enter the number of media channels according to your environments transcoding calls (e.g., **30**).
3. Click **Submit**.
4. Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.16 on page 87).

4.11 Step 11: Configure IP-to-IP Call Routing Rules

This step shows how to configure IP-to-IP call routing rules. These rules define the routes for forwarding SIP messages (e.g., INVITE) received from one IP entity to another. The E-SBC selects the rule whose configured input characteristics (e.g., IP Group) match those of the incoming SIP message. If the input characteristics do not match the first rule in the table, they are compared to the second rule, and so on, until a matching rule is located. If no rule is matched, the message is rejected. The routing rules use the configured IP Groups to denote the source and destination of the call. As configured in Section 4.5 on page 44, IP Group 1 represents Lync Server 2013, and IP Group 2 represents Bell Canada's SIP Trunk.

For the interoperability test topology, the following IP-to-IP routing rules must be configured to route calls between Lync Server 2013 (LAN) and Bell Canada's SIP Trunk (WAN):

- Terminate SIP OPTIONS messages on the E-SBC that are received from the LAN
- Calls from Lync Server 2013 to Bell Canada's SIP Trunk
- Calls from Bell Canada's SIP Trunk to Lync Server 2013

➤ To configure IP-to-IP routing rules:

1. Open the IP-to-IP Routing Table page (**Configuration** tab > **VoIP** menu > **SBC** > **Routing SBC** > **IP-to-IP Routing Table**).
2. Configure a rule to terminate SIP OPTIONS messages received from the LAN:
 - a. Click **Add**.
 - b. Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	0
Route Name	OPTIONS termination (arbitrary descriptive name)
Source IP Group ID	1
Request Type	OPTIONS
Destination Type	Dest Address
Destination Address	Internal

Figure 4-37: Configuring IP-to-IP Routing Rule for Terminating SIP OPTIONS from LAN – Rule Tab

The screenshot shows the 'Rule' tab of a configuration window. It contains the following fields and values:

Index	0
Route Name	OPTIONS termination
Source IP Group ID	1
Source Username Prefix	*
Source Host	*
Destination Username Prefix	*
Destination Host	*
Request Type	OPTIONS
Message Condition	None
ReRoute IP Group ID	-1
Call Trigger	Any

At the bottom right, there are 'Submit' and 'Cancel' buttons.

3. Click the **Action** tab, and then configure the parameters as follows:

Parameter	Value
Destination Type	Dest Address
Destination Address	internal

Figure 4-38: Configuring IP-to-IP Routing Rule for Terminating SIP OPTIONS from LAN – Action Tab

The screenshot shows the 'Action' tab of the same configuration window. It contains the following fields and values:

Index	0
Destination Type	Dest Address
Destination IP Group ID	-1
Destination SRD ID	None
Destination Address	internal
Destination Port	0
Destination Transport Type	
Alternative Route Options	Route Row
Group Policy	None
Cost Group	None
Rules Set Id	-1

At the bottom right, there are 'Submit' and 'Cancel' buttons.

4. Configure a rule to route calls from Lync Server 2013 to Bell Canada's SIP Trunk:
 - a. Click **Add**.
 - b. Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	1
Route Name	Lync to ITSP (arbitrary descriptive name)
Source IP Group ID	1

Figure 4-39: Configuring IP-to-IP Routing Rule for Lync to ITSP – Rule tab

Parameter	Value
Index	1
Route Name	Lync to ITSP
Source IP Group ID	1
Source Username Prefix	*
Source Host	*
Destination Username Prefix	*
Destination Host	*
Request Type	All
Message Condition	None
ReRoute IP Group ID	-1
Call Trigger	Any

5. Click the **Action** tab, and then configure the parameters as follows:

Parameter	Value
Destination Type	IP Group
Destination IP Group ID	2
Destination SRD ID	2

Figure 4-40: Configuring IP-to-IP Routing Rule for Lync to ITSP – Action tab

Rule Action	
Index	1
Destination Type	IP Group
Destination IP Group ID	2
Destination SRD ID	2
Destination Address	
Destination Port	0
Destination Transport Type	
Alternative Route Options	Route Row
Group Policy	None
Cost Group	None
Rules Set Id	-1

6. Configure a rule to route calls from Bell Canada's SIP Trunk to Lync Server 2013:
- Click **Add**.
 - Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	2
Route Name	ITSP to Lync (arbitrary descriptive name)
Source IP Group ID	2

Figure 4-41: Configuring IP-to-IP Routing Rule for ITSP to Lync – Rule tab

Rule	
Index	2
Route Name	ITSP to Lync
Source IP Group ID	2
Source Username Prefix	*
Source Host	*
Destination Username Prefix	*
Destination Host	*
Request Type	All
Message Condition	None
ReRoute IP Group ID	-1
Call Trigger	Any

7. Click the **Action** tab, and then configure the parameters as follows:

Parameter	Value
Destination Type	IP Group
Destination IP Group ID	1
Destination SRD ID	1

Figure 4-42: Configuring IP-to-IP Routing Rule for ITSP to Lync – Action tab

Figure 4-43 shows the configured routing rules:

Figure 4-43: Configured IP-to-IP Routing Rules in IP-to-IP Routing Table

IP-to-IP Routing Table										
Index	Route Name	Source Host	Destination Username Prefix	Destination Host	Message Condition	ReRoute IP Group ID	Call Trigger	Destination Type	Destination IP Group ID	Destination Address
0	OPTIONS terminatio	*	*	*	None	-1	Any	Dest Address	-1	internal
1	Lync to ITSP	*	*	*	None	-1	Any	IP Group	2	
2	ITSP to Lync	*	*	*	None	-1	Any	IP Group	1	

Note: The routing configuration may change according to your specific deployment topology.

4.12 Step 12: Configure IP-to-IP Manipulation Rules

This step shows how to configure IP-to-IP manipulation rules. These rules manipulate the source and / or destination number. The manipulation rules use the configured IP Groups to denote the source and destination of the call. As configured in Section 4.5 on page 44, IP Group 1 represents Lync Server 2013, and IP Group 2 represents Bell Canada's SIP Trunk.

Note: Adapt the manipulation table according to your environment dial plan.

For this interoperability test topology, a manipulation is configured to add the "+" (plus sign) to the destination number for calls from IP Group 2 (Bell Canada's SIP Trunk) to IP Group 1 (i.e., Lync Server 2013) for any destination username prefix.

➤ **To configure a number manipulation rule:**

1. Open the IP-to-IP Outbound Manipulation page (**Configuration** tab > **VoIP** menu > **SBC** > **Manipulations SBC** > **IP-to-IP Outbound**).
2. Click **Add**.
3. Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	1
Source IP Group	2
Destination IP Group	1
Destination Username Prefix	* (asterisk sign)

Figure 4-44: Configuring IP-to-IP Outbound Manipulation Rule – Rule Tab

Rule	
Index	1
Manipulation Name	
Additional Manipulation	No
Source IP Group ID	2
Destination IP Group ID	1
Source Username Prefix	*
Source Host	*
Destination Username Prefix	*
Destination Host	*
Calling Name Prefix	*
Message Condition	None
Request Type	All
ReRoute IP Group ID	-1
Call Trigger	Any

Submit Cancel

4. Click the **Action** tab, and then configure the parameters as follows:

Parameter	Value
Manipulated Item	Destination URI
Prefix to Add	+ (plus sign)

Figure 4-45: Configuring IP-to-IP Outbound Manipulation Rule - Action Tab

5. Click **Submit**.

The figure below shows an example of configured IP-to-IP outbound manipulation rules for calls between IP Group 1 (i.e., Lync Server 2013) and IP Group 2 (i.e., Bell Canada's SIP Trunk):

Figure 4-46: Example of Configured IP-to-IP Outbound Manipulation Rules

IP to IP Outbound Manipulation												
Add + Insert +												
Index	Manipulation Name	Additional Manipulation	Source IP Group ID	Destination IP Group ID	Source Username Prefix	Source Host	Destination Username Prefix	Destination Host	Request Type	Manipulated Item	Prefix to Add	Suffix to Add
1		No	2	1	*	*	*	*	All	Destination	+	
2		No	1	2	*	*	+	*	All	Destination		
3		No	1	2	+	*	*	*	All	Source URI		

Page 1 of 1 Show 10 records per page View 1 - 3 of 3

Rule Index	Rule Action
1	Calls from IP Group 2 to IP Group 1 with any destination number (*), add "+" to the prefix of the destination number.
2	Calls from IP Group 1 to IP Group 2 with the prefix destination number "+", remove "+" from this prefix.
3	Calls from IP Group 1 to IP Group 2 with source number prefix "+", remove the "+" from this prefix.

4.13 Step 13: Configure Message Manipulation Rules

This step shows how to configure SIP message manipulation rules. SIP message manipulation rules can include insertion, removal, and/or modification of SIP headers. Manipulation rules are grouped into Manipulation Sets, enabling you to apply multiple rules to the same SIP message (IP entity).

After configuring the SIP message manipulation rules, you must assign them to the relevant IP Group (in the IP Group table) and determine whether they must be applied to inbound or outbound messages.

➤ **To configure SIP message manipulation rule:**

1. Open the Message Manipulations page (**Configuration** tab > **VoIP** menu > **SIP Definitions** > **Msg Policy & Manipulation** > **Message Manipulations**).
2. Add a manipulation rule to Index 0 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2). This removes the 'ms-opaque' parameter from the Contact Header.

Parameter	Value
Index	0
Manipulation Name	Remove ms-opaque
Manipulation Set ID	4
Message Type	any.request
Action Subject	header.contact.url.param.ms-opaque
Action Type	Remove

Figure 4-47: Configuring SIP Message Manipulation Rule 0 (for Bell Canada's SIP Trunk)

Edit Record #0

Index	0
Manipulation Name	Remove ms-opaque
Manipulation Set ID	4
Message Type	any.request
Condition	
Action Subject	header.contact.url.param.ms-opaque
Action Type	Remove ▼
Action Value	
Row Role	Use Current Condit ▼

3. Add a manipulation rule to Index 1 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada's SIP Trunk (IP Group 2). This rule normalizes the SIP Contact Header according to Bell Canada requirements.

Parameter	Value
Index	1
Manipulation Name	Add tgrp to contact
Manipulation Set ID	4
Action Subject	header.contact.url.user
Action Type	Modify
Action Value	header.from.url.user+';tgrp=vend5_6132606020_01a;trunk-context=siptrunking.bell.ca'
Row Role	Use Previous Condition

Figure 4-48: Configuring SIP Message Manipulation Rule 1 (for Bell Canada's SIP Trunk)

4. Add a manipulation rule to Index 2 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2). This adds the '<sip:6132606020@vendor5.lab.internetvoice.ca;user=phone>' Diversion Header string in case the History-Info Header exists, where 6132606020 is the trunk's main line.

Parameter	Value
Index	2
Manipulation Name	Add Diversion
Manipulation Set ID	4
Condition	header.history-info exists
Action Subject	header.diversion
Action Type	Add
Action Value	'<sip:6132606020@vendor5.lab.internetvoice.ca;user=phone>'

Figure 4-49: Configuring SIP Message Manipulation Rule 2 (for Bell Canada's SIP Trunk)

Index	2
Manipulation Name	Add Diversion
Manipulation Set ID	4
Message Type	
Condition	header.history-info exists
Action Subject	header.diversion
Action Type	Add
Action Value	'<sip:6132606020@ven
Row Role	Use Current Condit

5. Add a manipulation rule to Index 3 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2) for a Call Forward initiated by the Lync Server 2013 (IP Group 1). This replaces the user part of the Diversion Header with the value from the History-Info Header.

Parameter	Value
Index	3
Manipulation Name	Call Forward
Manipulation Set ID	4
Message Type	any.request
Condition	header.history-info.0 regex (<sip:)(.)(.)(*)(@)(.)(*)
Action Subject	header.diversion.url.user
Action Type	Modify
Action Value	\$3

Figure 4-50: Configuring SIP Message Manipulation Rule 3 (for Bell Canada's SIP Trunk)

Index	3
Manipulation Name	Call Forward
Manipulation Set ID	4
Message Type	any.request
Condition	header.history-info.0 re
Action Subject	header.diversion.url.use
Action Type	Modify
Action Value	\$3
Row Role	Use Current Condit

6. Add a manipulation rule to Index 4 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2) for Call Transfer or Forward initiated by the Lync Server 2013 (IP Group 1). This replaces the host part of the Diversion Header with the value from the From Header, in case the Diversion Header exists.

Parameter	Value
Index	4
Manipulation Name	Transfer & Forward
Manipulation Set ID	4
Message Type	any.request
Condition	header.diversion exists
Action Subject	header.diversion.url.host
Action Type	Modify
Action Value	header.from.url.host

Figure 4-51: Configuring SIP Message Manipulation Rule 4 (for Bell Canada's SIP Trunk)

7. Add a manipulation rule to Index 5 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2). This adds the '<sip:6132606021@vendor5.lab.internetvoice.ca;user=phone>' Diversion Header string in case the Referred-By Header exists, where 6132606020 is the trunk's main line.

Parameter	Value
Index	5
Manipulation Name	Call Transfer
Manipulation Set ID	4
Condition	header.referred-by exists
Action Subject	header.diversion
Action Type	Add
Action Value	'<sip:6132606020@vendor5.lab.internetvoice.ca;user=phone>'

Condition	header.referred-by exist
Action Subject	header.diversion
Action Type	Add
Action Value	'<sip:6132606020@ven
Row Role	Use Current Condit
Submit Cancel	

8. Add a manipulation rule to Index 6 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2) based on the previous rule condition. This replaces the user part of the Diversion Header with the value from the Referred-By Header.

Parameter	Value
Index	6
Manipulation Name	Call Transfer
Manipulation Set ID	4
Action Subject	header.diversion.url.user
Action Type	Modify
Action Value	header.referred-by.url.user
Row Role	Use Previous Condition

Row Role	Use Previous Condi
Submit Cancel	

9. Add a manipulation rule to Index 7 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2) for a Call Transfer initiated by the Lync Server 2013 (IP Group 1). This removes the '+' prefix from the user part of the Diversion Header.

Parameter	Value
Index	7
Manipulation Name	Call Transfer
Manipulation Set ID	4
Message Type	any.request
Action Subject	header.diversion.url.user
Action Type	Remove Prefix
Action Value	'+'

Submit Cancel	

11. Add a manipulation rule to Index 9 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2) for Rejected Calls initiated by the Lync Server 2013 (IP Group 1). This replaces the method type '603' with the value '486', because Bell Canada's SIP Trunk does not recognize the '603' method type.

Parameter	Value
Index	9
Manipulation Name	Decline Cause
Manipulation Set ID	4

Page 1 of 2 Show 10 records per page View 1 - 10 of 13							

The table displayed below includes SIP message manipulation rules that are bound together by common Manipulation Set IDs 1 and 4, which are executed for messages sent to and from the Bell Canada SIP Trunk (IP Group 2) as well as the Lync Server 2013 (IP Group 1). These rules are specifically required to enable proper interworking between Bell Canada's SIP Trunk and Lync Server 2013. Refer to the *User's Manual* for further details concerning the full capabilities of header manipulation.

Rule Index	Rule Description	Reason for Introducing Rule
0	This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2). This removes the 'ms-opaque' parameter from Contact Header.	-
1	This rule applies to messages sent to the Bell Canada's SIP Trunk (IP Group 2). This rule normalizes the SIP Contact Header according to Bell Canada requirements.	-
2	This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2). This adds the '<sip: 6132606020@cust5-tor.vsac.bell.ca>' string to Diversion Header in case History-Info Header exists, where 6132606020 is the trunk's main line.	-
3	This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2) for Call Forward initiated by the Lync Server 2013 (IP Group 1). This replaces the user part of the Diversion Header with the value from the History-Info Header.	For Call Forward initiated by the Lync Server 2013.
4	This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2) for Call Transfer or Forward initiated by the Lync Server 2013 (IP Group 1). This replaces the host part of the Diversion Header with the value from the From Header in case the Diversion Header exists.	For Call Transfer or Forward initiated by Lync Server 2013, Bell Canada's SIP Trunk needs to replace the host part of the Diversion Header with the value from the From Header in case the Diversion Header exists.

Rule Index	Rule Description	Reason for Introducing Rule
5	This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2). This adds the '<sip:6132606021@vendor5.lab.internetvoice.ca;user=phone>' Diversion Header string in case the Referred-By Header exists, where 6132606020 is the trunk's main line.	For Call Transfer initiated by the Lync Server 2013.
6	This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2) based on the previous rule condition. This replaces the user part of the Diversion Header with the value from the Referred-By Header.	For Call Transfer initiated by the Lync Server 2013.
7	This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2). This removes the '+' prefix from the user part of Diversion Header.	For Call Transfer initiated by the Lync Server 2013.
8	This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2) for Call Transfer initiated by the Lync Server 2013 (IP Group 1). This removes the Referred-By Header.	Bell Canada's SIP Trunk does not support "Referred-By" Header in SIP INVITE messages, so it is necessary to remove it.
9	This rule applies to response messages sent to the Bell Canada SIP Trunk (IP Group 2) for Rejected Calls initiated by the Lync Server 2013 (IP Group 1). This replaces the method type '603' with the value '486'.	Bell Canada's SIP Trunk does not recognize the '603' method type.

12. Assign Manipulation Set ID 1 to IP Group 1:
 - a. Open the IP Group Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **IP Group Table**).
 - b. Select the row of IP Group 1, and then click **Edit**.
 - c. Click the **SBC** tab.
 - d. Set the 'Inbound Message Manipulation Set' field to **1**.

Figure 4-58: Assigning Manipulation Set to IP Group 1

Common GW SBC	
Index	1
Classify By Proxy Set	Enable

- e. Click **Submit**.

13. Assign Manipulation Set ID 4 to IP Group 2:
 - a. Open the IP Group Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **IP Group Table**).
 - b. Select the row of IP Group 2, and then click **Edit**.
 - c. Click the **SBC** tab.
 - d. Set the 'Outbound Message Manipulation Set' field to 4.

Figure 4-59: Assigning Manipulation Set 4 to IP Group 2

The screenshot shows the configuration page for IP Group 2, SBC tab. The page has three tabs: Common, GW, and SBC. The SBC tab is selected. The form contains the following fields:

Field	Value
Index	2
Classify By Proxy Set	Enable
Max. Number of Registered Users	-1
Inbound Message Manipulation Set	-1
Outbound Message Manipulation Set	4
Registration Mode	User Initiates Registr...
Authentication Mode	User Authenticates
Authentication Method List	
SBC Client Forking Mode	Sequential
Source URI Input	Not Configured
Destination URI Input	Not Configured
Username	
Password	

At the bottom right, there are two buttons: **Submit** and **Cancel**.

- e. Click **Submit**.

4.14 Step 14: Configure Registration Accounts

This step shows how to configure SIP registration accounts. This is required so that the E-SBC can register with the Bell Canada SIP Trunk on behalf of Lync Server 2013. The Bell Canada SIP Trunk does not require registration, only authentication to provide service.

In the interoperability test topology, the Served IP Group is Lync Server 2013 (IP Group 1) and the Serving IP Group is Bell Canada's SIP Trunk (IP Group 2).

➤ **To configure a registration account:**

1. Open the Account Table page (**Configuration** tab > **VoIP** menu > **SIP Definitions** > **Account Table**).

Figure 4-60: Configuring SIP Registration Account

Index	Served Trunk Group	Served IP Group	Serving IP Group	User Name	Password	Host Name	Register	Contact User	Application Type
0	-1	1	2	4167751876	*	123.123.123.123	No	4167751876	SBC

2. Enter an index number (e.g., "0"), and then click **Add**.
3. Configure the account according to the provided information from Bell Canada, for example:

Parameter	Value
Served IP Group	1 (Lync Server 2013)
Serving IP Group	2 (Bell Canada's SIP Trunk)
Username	As provided by Bell Canada
Password	As provided by Bell Canada
Host Name	123.123.123.123
Register	No
Contact User	4167751876 (trunk main line)
Application Type	SBC

4. Click **Apply**.

4.15 Step 15: Configure Miscellaneous Settings

This section describes configuration of miscellaneous E-SBC settings.

4.15.1 Step 15a: Configure Classification Table

This step is only relevant to configuration with Bell Canada Load Balancer. It shows how to configure the E-SBC Classification Table. For the interoperability test topology with Bell Canada Load Balancer, when Load Balancer IP / FQDN is configured in Proxy Set, it's necessary to allow messages to be received from Bell Canada SBCs. The Classification Table does this.

➤ **To configure Classification Table:**

1. Open the Classification Table page (**Configuration** tab > **VoIP** menu > **SBC** > **Routing SBC** > **Classification Table**).
2. Click **Add**.
3. Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	0
Classification Name	BellCanada-SBC1 (arbitrary descriptive name)
Source SRD ID	2
Source IP Address	123.123.123.123 (IP address received from Bell Canada)
Source Port	5060
Source Transport Type	UDP

Figure 4-61: Classification Table Page – Rule Tab

Rule	
Index	0
Classification Name	BellCanada-SBC1
Message Condition	None
Source SRD ID	2
Source IP Address	123.123.123.123
Source Port	5060
Source Transport Type	UDP
Source Username Prefix	*
Source Host	*
Destination Username Prefix	*
Destination Host	*

Submit Cancel

4. Click the **Action** tab, and then configure the parameters as follows:

Parameter	Value
Action Type	Allow
Source IP Group ID	2

Figure 4-62: Classification Table Page – Action Tab

5. Click **Submit**.

Figure 4-63: Example of Classification Table

Classification Table								
Add +								
Index	Classification Name	Message Condition	Source SRD ID	Source IP Address	Source Port	Source Username Prefix	Destination Host	Action Type
0	BellCanada-SBC1	None	2	123.123.123.123	5060	*	*	Allow
1	BellCanada-SBC2	None	2	123.123.123.124	5060	*	*	Allow
Page 1 of 1 Show 10 records per page View 1 - 2 of 2								

4.15.2 Step 15b: Configure Call Forking Mode

This step shows how to configure the E-SBC's handling of SIP 18x responses received for call forking of INVITE messages. For the interoperability test topology, if 18x with SDP is received, the E-SBC opens a voice stream according to the received SDP. The E-SBC re-opens the stream according to subsequently received 18x responses with SDP or plays a ringback tone if a 180 response without SDP is received. It's mandatory to set this field for the Lync Server 2013 environment.

➤ **To configure call forking:**

1. Open the General Settings page (**Configuration** tab > **VoIP** menu > **SBC** > **General Settings**).
2. From the 'SBC Forking Handling Mode' drop-down list, select **Sequential**.

Figure 4-64: Configuring Forking Mode

Transcoding Mode	Only If Required
No Answer Timeout [sec]	600
GRUU Mode	As Proxy
Minimum Session-Expires [sec]	90
BroadWorks Survivability Feature	Disable
BYE Authentication	Disable
User Registration Time [sec]	0
Proxy Registration Time [sec]	0
Survivability Registration Time [sec]	0
Forking Handling Mode	Sequential
Unclassified Calls	Reject
Session-Expires [sec]	180
Direct Media	Disable
Preferences Mode	Include Extensions
User Registration Grace Time [sec]	0
Fax Detection Timeout [sec]	10
RTCP Mode	Transparent
Max Forwards Limit	10

3. Click **Submit**.

4.15.3 Step 15c: Configure SBC Session Refreshing Policy

This step shows how to configure the 'SBC Session Refreshing Policy' parameter. In some cases, Microsoft Lync does not perform a refresh of Session Timer even when it confirms that it will be refresher. To resolve this issue, the SBC is configured as Session Expire refresher.

➤ **To configure SBC Session Refreshing Policy:**

1. Open the Admin page: Append the case-sensitive suffix 'AdminPage' to the device's IP address in your Web browser's URL field (e.g., <http://10.15.17.15/AdminPage>).
2. In the left pane of the page that opens, click *ini* Parameters.

Figure 4-65: Configuring SBC Session Refreshing Policy in AdminPage

Parameter Name: Enter Value:

Output Window

```
Parameter Name: SBCSESSIONREFRESHINGPOLICY
Parameter New Value: 1
Parameter Description: Defines whether Remote or SBC should be refresher when
SBC terminates the Session Expire refreshing
```

3. Enter these values in the 'Parameter Name' and 'Enter Value' fields:

Parameter	Value
SBCSESSIONREFRESHINGPOLICY	1 (enables SBC as refresher of Session Timer)

4. Click the **Apply New Value** button for each field.

4.16 Step 16: Reset the E-SBC

After completing configuration of the E-SBC, save ("burn") the configuration to the E-SBC's flash memory with a reset for the settings to take effect.

➤ **To save the configuration to flash memory:**

1. Open the Maintenance Actions page (**Maintenance** tab > **Maintenance** menu > **Maintenance Actions**).

Figure 4-66: Resetting the E-SBC

The screenshot displays a web-based configuration interface for an E-SBC. It is divided into three main sections: 'Reset Configuration', 'LOCK / UNLOCK', and 'Save Configuration'. The 'Reset Configuration' section includes a 'Reset Board' button, a 'Burn To FLASH' dropdown menu set to 'Yes', and a 'Graceful Option' dropdown menu set to 'No'. The 'LOCK / UNLOCK' section includes a 'Lock' button, a 'Graceful Option' dropdown menu set to 'No', and a 'Gateway Operational State' label showing 'UNLOCKED'. The 'Save Configuration' section includes a 'Burn To FLASH' button labeled 'BURN'.

Reset Configuration	
Reset Board	Reset
Burn To FLASH	Yes
Graceful Option	No

LOCK / UNLOCK	
Lock	LOCK
Graceful Option	No
Gateway Operational State	UNLOCKED

Save Configuration	
Burn To FLASH	BURN

2. Ensure that the 'Burn to FLASH' field is set to **Yes** (default).
3. Click the **Reset** button.

This page is intentionally left blank.

A AudioCodes *ini* File

The *ini* configuration file of the E-SBC, corresponding to the Web-based configuration as described in Section 4 on page 31, is shown below:

Note: To load and save an *ini* file, open the Web interface and access the Configuration File page (**Maintenance** tab > **Software Update** menu > **Configuration File**).

B Configuring Dynamic ONND

The procedure below describes additional steps needed to configure Dynamic Outgoing Name & Number Display (ONND) presentation mode.

B.1 Configure SIP Message Manipulation Rules

The following SIP message manipulation rules should be configured in order to work in Dynamic ONND mode.

➤ **To configure SIP message manipulation rules:**

1. Open the Message Manipulations page (**Configuration** tab > **VoIP** menu > **SIP Definitions** > **Msg Policy & Manipulation** > **Message Manipulations**).
2. Add a manipulation rule to Index 10 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2). This removes the 'userphone' parameter from the SIP To Header.

Parameter	Value
Index	10
Manipulation Name	Dynamic ONND
Manipulation Set ID	4
Message Type	any.request
Action Subject	header.to.url.userphone
Action Type	Remove

Figure B-1: Configuring SIP Message Manipulation Rule 10 (for Bell Canada's SIP Trunk)

Edit Record #10	
Index	10
Manipulation Name	Dynamic ONND
Manipulation Set ID	4
Message Type	any.request
Condition	
Action Subject	header.to.url.userphone
Action Type	Remove ▼
Action Value	
Row Role	Use Current Condit ▼
Submit Cancel	

3. Add a manipulation rule to Index 11 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2). This removes the 'userphone' parameter from the SIP From Header.

Parameter	Value
Index	11
Manipulation Name	Dynamic ONND
Manipulation Set ID	4
Message Type	any.request
Action Subject	header.from.url.userphone
Action Type	Remove

Figure B-2: Configuring SIP Message Manipulation Rule 11 (for Bell Canada's SIP Trunk)

4. Add a manipulation rule to Index 12 for Bell Canada's SIP Trunk (Manipulation Set ID 4). This rule applies to messages sent to the Bell Canada SIP Trunk (IP Group 2). This removes the 'userphone' parameter from the SIP P-Asserted-Identity Header.

Parameter	Value
Index	12
Manipulation Name	Dynamic ONND
Manipulation Set ID	4
Message Type	any.request
Action Subject	header.p-asserted-identity.url.userphone
Action Type	Remove
