1 Introduction

This Configuration Note describes how to set up the AudioCodes Enterprise Session Border Controller (hereafter, referred to as *E-SBC*) for interworking between Virgin Media's SIP Trunk and Microsoft's Lync Server 2013 environment.

1.1 Intended Audience

The document is intended for engineers, or AudioCodes and Virgin Media Partners who are responsible for installing and configuring Virgin Media's SIP Trunk and Microsoft's Lync Server 2013 for enabling VoIP calls using AudioCodes E-SBC.

1.2 About AudioCodes E-SBC Product Series

AudioCodes' family of E-SBC devices enables reliable connectivity and security between the Enterprise's and the service provider's VoIP networks.

The E-SBC provides perimeter defense as a way of protecting Enterprises from malicious VoIP attacks; mediation for allowing the connection of any PBX and/or IP-PBX to any service provider; and Service Assurance for service quality and manageability.

Designed as a cost-effective appliance, the E-SBC is based on field-proven VoIP and network services with a native host processor, allowing the creation of purpose-built multiservice appliances, providing smooth connectivity to cloud services, with integrated quality of service, SLA monitoring, security and manageability. The native implementation of SBC provides a host of additional capabilities that are not possible with standalone SBC appliances such as VoIP mediation, PSTN access survivability, and third-party value-added services applications. This enables Enterprises to utilize the advantages of converged networks and eliminate the need for standalone appliances.

AudioCodes E-SBC is available as an integrated solution running on top of its field-proven Mediant Media Gateway and Multi-Service Business Router platforms, or as a software-only solution for deployment with third-party hardware.

This page is intentionally left blank.

2 Component Information

2.1 AudioCodes E-SBC Version

Table 2-1: AudioCodes E-SBC Version

SBC Vendor	AudioCodes
Models	<ul style="list-style-type: none"> ▪ Mediant 800 Gateway & E-SBC ▪ Mediant 1000B Gateway & E-SBC ▪ Mediant 3000 Gateway & E-SBC ▪ Mediant 2600 E-SBC ▪ Mediant 4000 E-SBC
Software Version	SIP_6.80A.009.005
Protocol	<ul style="list-style-type: none"> ▪ SIP/UDP (to the Virgin Media SIP Trunk) ▪ SIP/TCP or TLS (to the Lync FE Server)
Additional Notes	None

Vendor	Microsoft
Model	Microsoft Lync
Software Version	Release 2013 5.0.8308.0
Protocol	SIP
Additional Notes	None

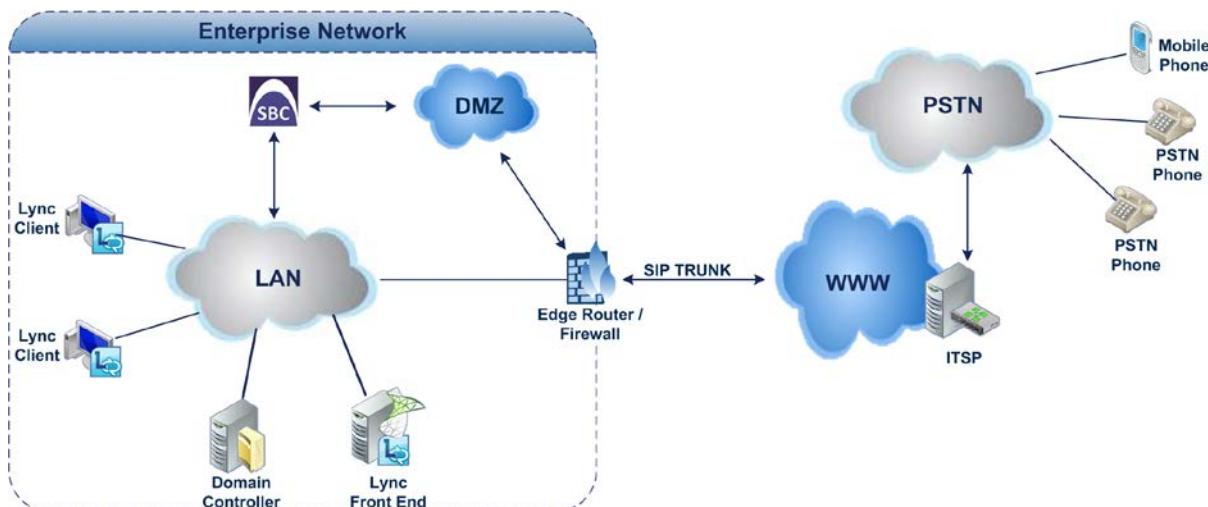

2.4 Interoperability Test Topology

The interoperability testing between AudioCodes E-SBC and Virgin Media SIP Trunk with Lync 2013 was done using the following topology setup:

- Enterprise deployed with Microsoft Lync Server 2013 in its private network for enhanced communication within the Enterprise.
- Enterprise wishes to offer its employees enterprise-voice capabilities and to connect the Enterprise to the PSTN network using Virgin Media's SIP Trunking service.
- AudioCodes E-SBC is implemented to interconnect between the Enterprise LAN and the SIP Trunk.
 - **Session:** Real-time voice session using the IP-based Session Initiation Protocol (SIP).
 - **Border:** IP-to-IP network border between Lync Server 2013 network in the Enterprise LAN and Virgin Media's SIP Trunk located in the public network.

The figure below illustrates this interoperability test topology:

Figure 2-1: Interoperability Test Topology between E-SBC and Microsoft Lync with Virgin Media SIP Trunk

2.4.1 Environment Setup

The interoperability test topology includes the following environment setup:

Table 2-4: Environment Setup

Area	Setup
Network	<ul style="list-style-type: none">▪ Microsoft Lync Server 2013 environment is located on the Enterprise's LAN▪ Virgin Media SIP Trunk is located on the WAN
Signaling Transcoding	<ul style="list-style-type: none">▪ Microsoft Lync Server 2013 operates with SIP-over-TLS transport type▪ Virgin Media SIP Trunk operates with SIP-over-UDP transport type
Codecs Transcoding	<ul style="list-style-type: none">▪ Microsoft Lync Server 2013 supports G.711A-law and G.711U-law coders▪ Virgin Media SIP Trunk supports G.711A-law, G.711U-law, and G.729 coder
Media Transcoding	<ul style="list-style-type: none">▪ Microsoft Lync Server 2013 operates with SRTP media type▪ Virgin Media SIP Trunk operates with RTP media type

2.4.2 Known Limitations

There were no limitations observed in the interoperability tests done for the AudioCodes E-SBC interworking between Microsoft Lync Server 2013 and Virgin Media's SIP Trunk.

This page is intentionally left blank.

3 Configuring Lync Server 2013

This chapter describes how to configure Microsoft Lync Server 2013 to operate with AudioCodes E-SBC.

Note: Dial plans, voice policies, and PSTN usages are also necessary for Enterprise voice deployment; however, they are beyond the scope of this document.

3.1 Configuring the E-SBC as an IP / PSTN Gateway

The procedure below describes how to configure the E-SBC as an IP / PSTN Gateway.

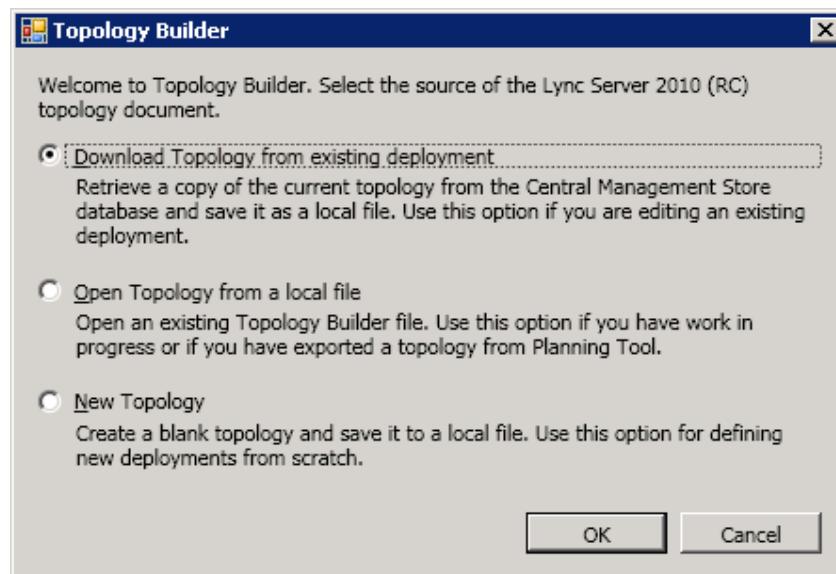

- **To configure E-SBC as IP/PSTN Gateway and associate it with Mediation Server:**
1. On the server where the Topology Builder is installed, start the Lync Server 2013 Topology Builder (Windows Start menu > All Programs > Lync Server Topology Builder), as shown below:

Figure 3-1: Starting the Lync Server Topology Builder

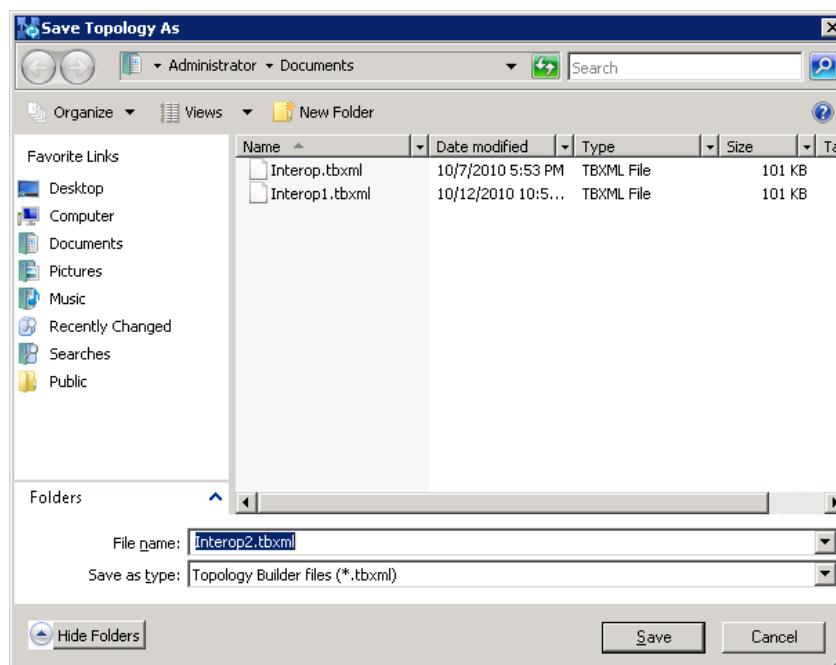

The following is displayed:

Figure 3-2: Topology Builder Dialog Box

2. Select the **Download Topology from existing deployment** option, and then click **OK**; you are prompted to save the downloaded Topology:

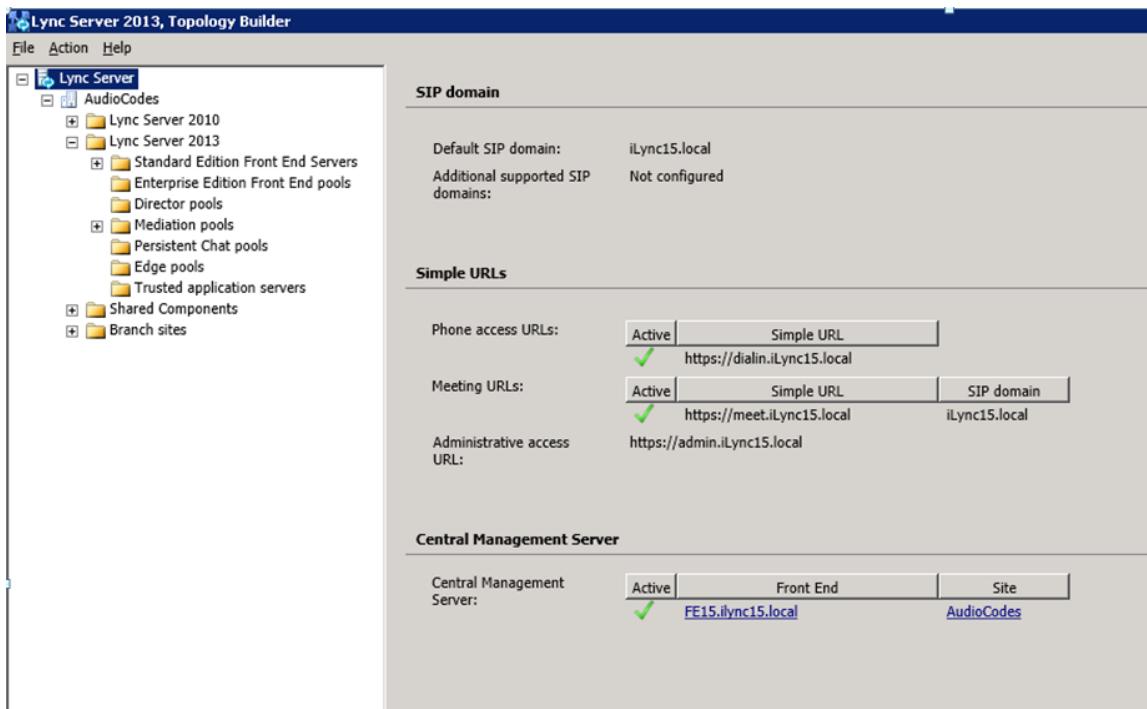

Figure 3-3: Save Topology Dialog Box

3. Enter a name for the Topology file, and then click **Save**. This step enables you to roll back from any changes you make during the installation.

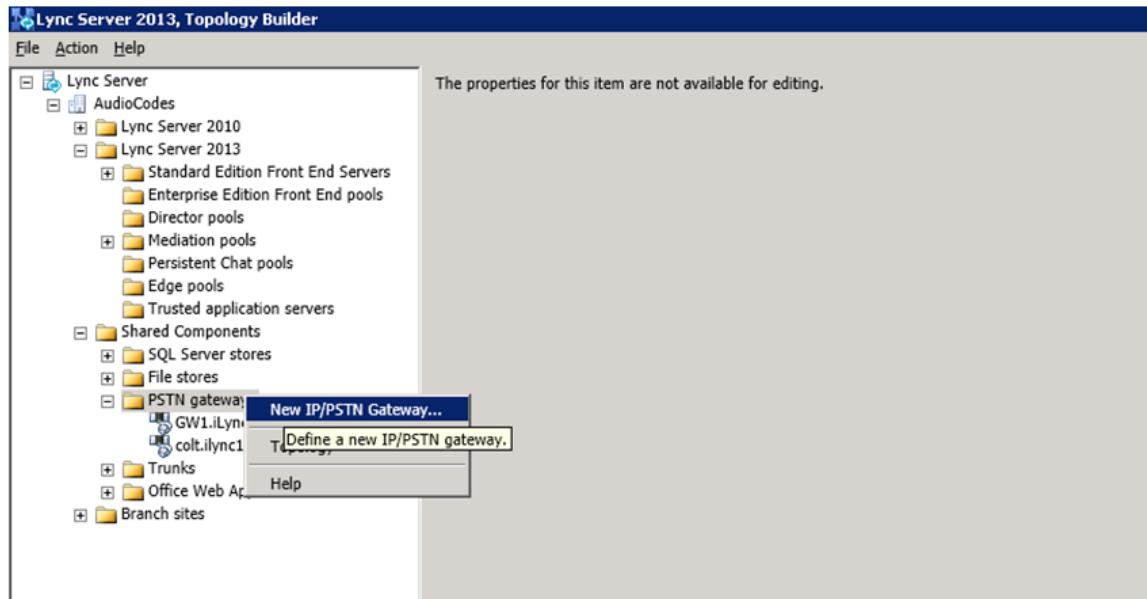

The Topology Builder screen with the downloaded Topology is displayed:

Figure 3-4: Downloaded Topology

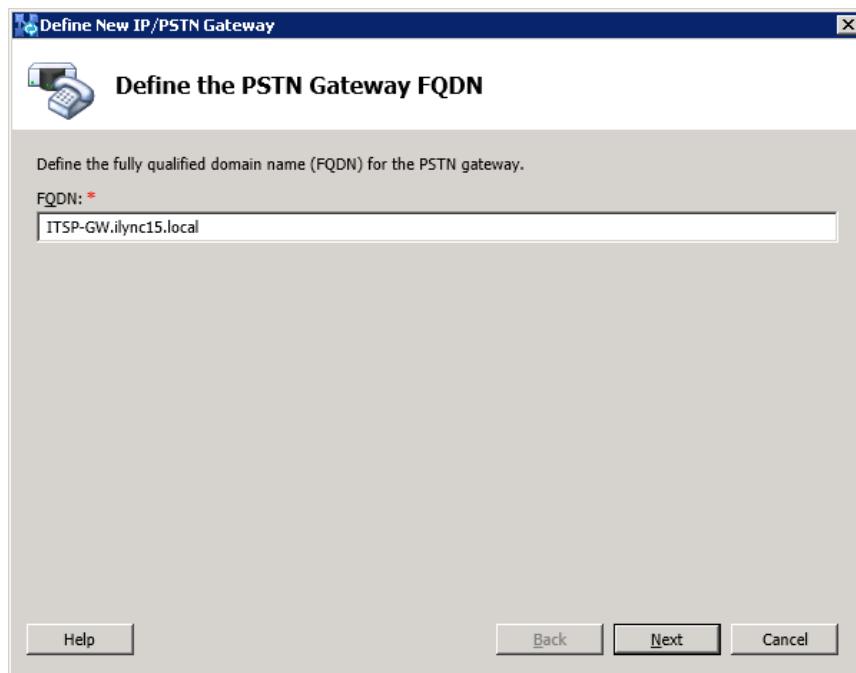

- Under the **Shared Components** node, right-click the **PSTN gateways** node, and then from the shortcut menu, choose **New IP/PSTN Gateway**, as shown below:

Figure 3-5: Choosing New IP/PSTN Gateway

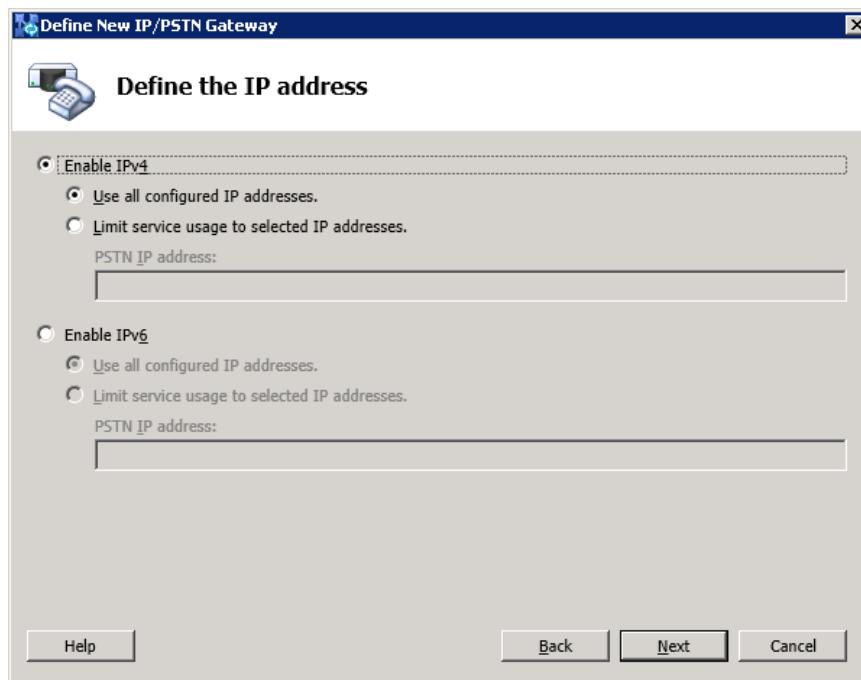

The following is displayed:

Figure 3-6: Define the PSTN Gateway FQDN

5. Enter the Fully Qualified Domain Name (FQDN) of the E-SBC (e.g., **ITSP-GW.ilync15.local**). Update this FQDN in the relevant DNS record, and then click **Next**; the following is displayed:

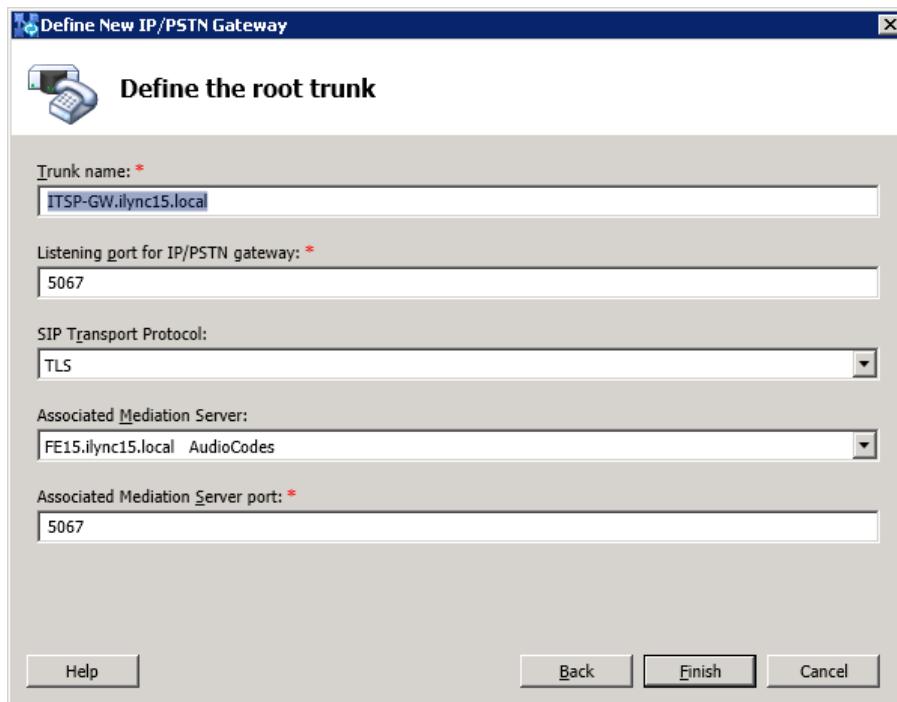

Figure 3-7: Define the IP Address

6. Define the listening mode (IPv4 or IPv6) of the IP address of your new PSTN gateway, and then click **Next**.
7. Define a *root trunk* for the PSTN gateway. A trunk is a logical connection between the Mediation Server and a gateway uniquely identified by the following combination: Mediation Server FQDN, Mediation Server listening port (TLS or TCP), gateway IP and FQDN, and gateway listening port.

**Notes:**

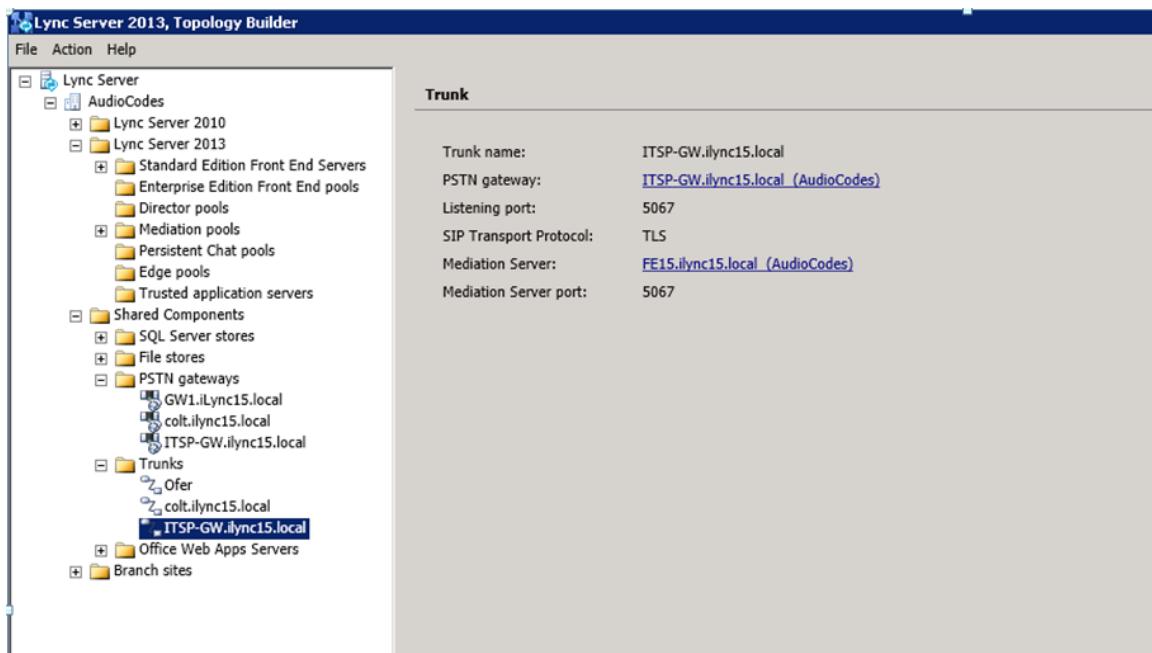

- When defining a PSTN gateway in Topology Builder, you must define a root trunk to successfully add the PSTN gateway to your topology.
- The root trunk cannot be removed until the associated PSTN gateway is removed.

Figure 3-8: Define the Root Trunk

- In the 'Listening Port for IP/PSTN Gateway' field, enter the listening port that the E-SBC will use for SIP messages from the Mediation Server that will be associated with the root trunk of the PSTN gateway (e.g., **5067**).
- In the 'SIP Transport Protocol' field, select the transport type (e.g., **TLS**) that the trunk uses.
- In the 'Associated Mediation Server' field, select the Mediation Server pool to associate with the root trunk of this PSTN gateway.
- In the 'Associated Mediation Server Port' field, enter the listening port that the Mediation Server will use for SIP messages from the SBC (e.g., **5067**).
- Click **Finish**.

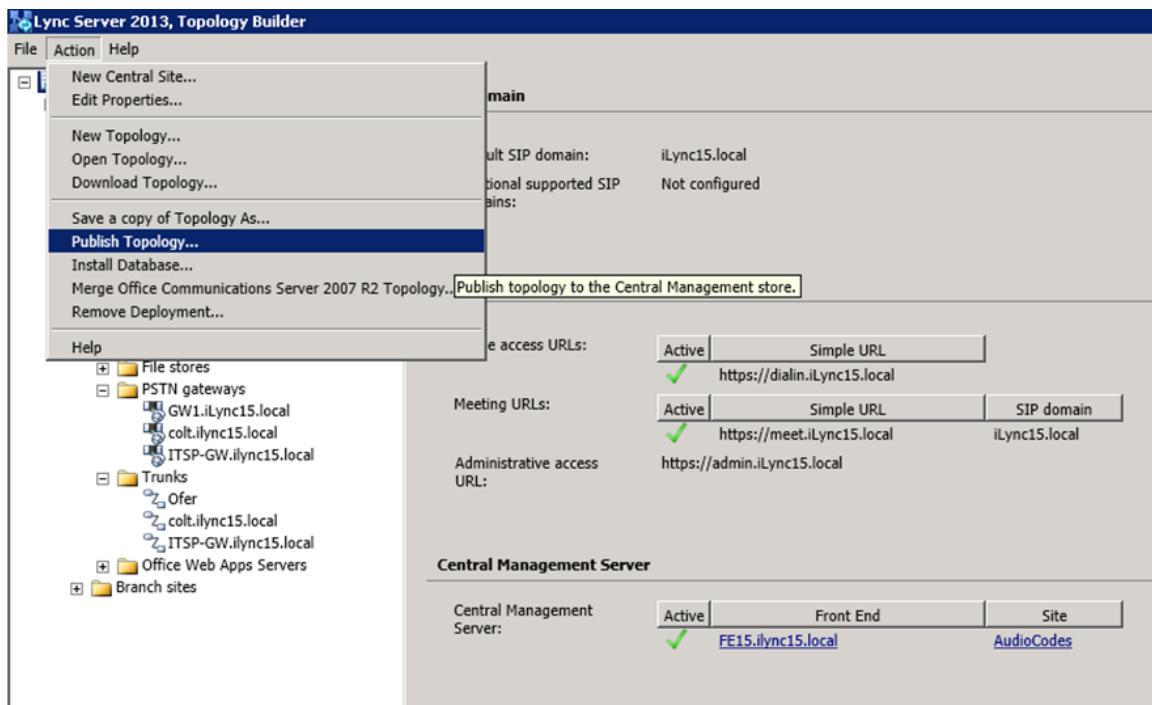

The E-SBC is added as a PSTN gateway, and a trunk is created as shown below:

Figure 3-9: E-SBC added as IP/PSTN Gateway and Trunk Created

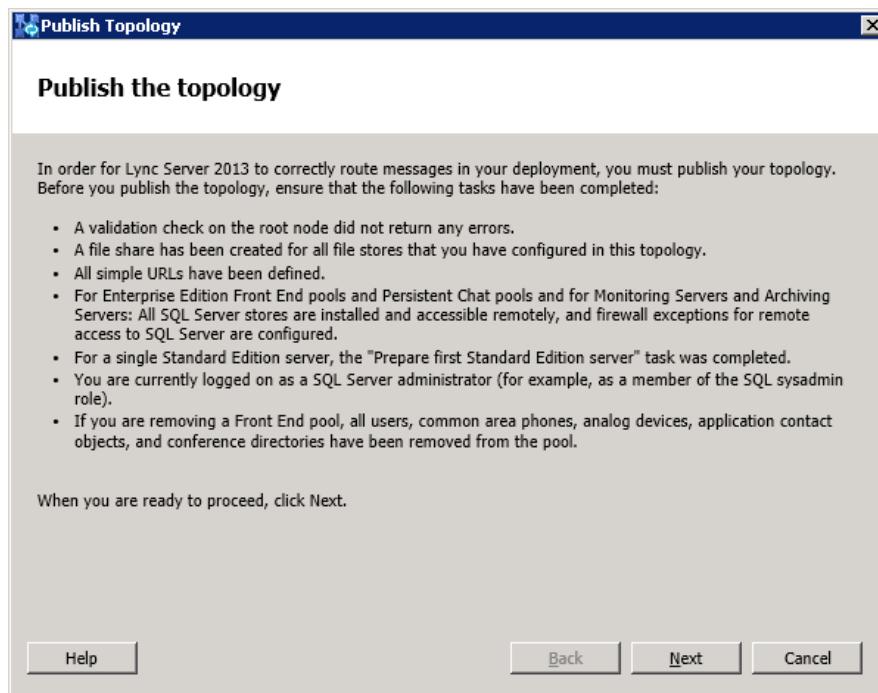

8. Publish the Topology: In the main tree, select the root node **Lync Server**, and then from the **Action** menu, choose **Publish Topology**, as shown below:

Figure 3-10: Choosing Publish Topology

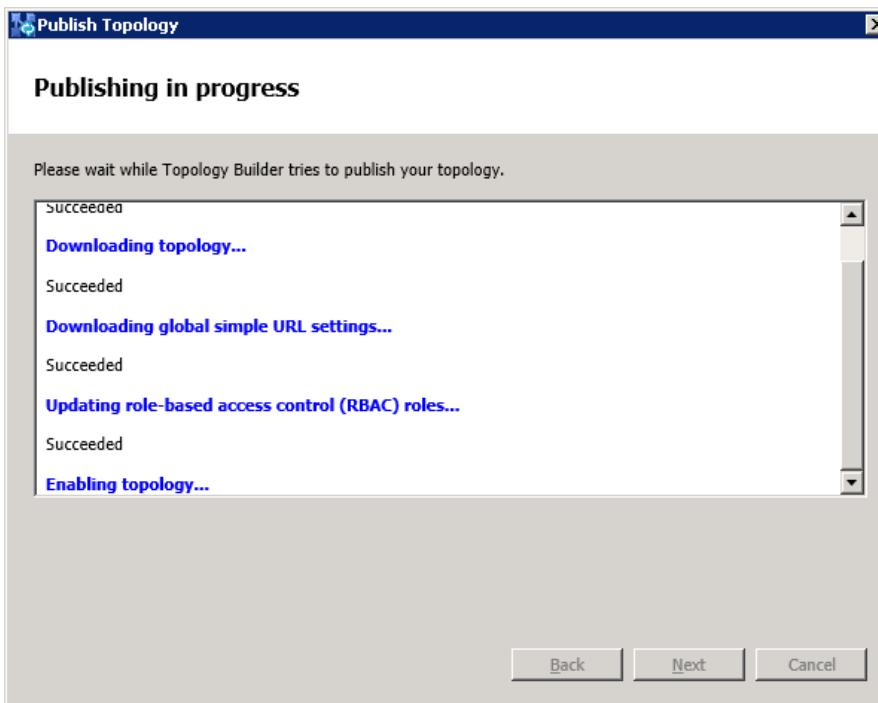

The following is displayed:

Figure 3-11: Publish the Topology

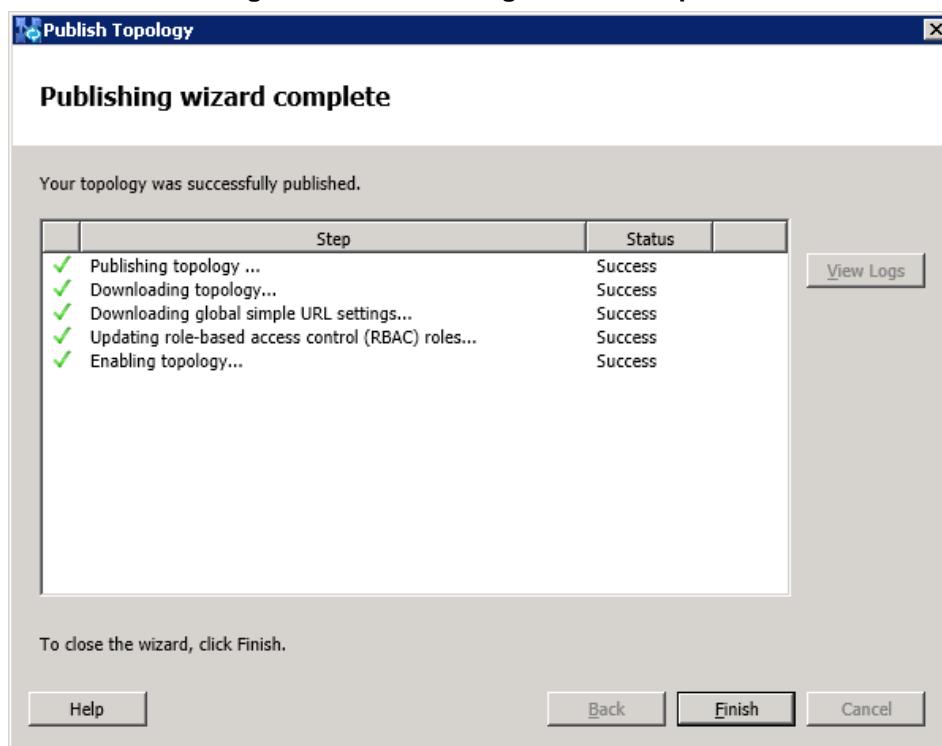

9. Click **Next**; the Topology Builder starts to publish your topology, as shown below:

Figure 3-12: Publishing in Progress

- 10.** Wait until the publishing topology process completes successfully, as shown below:

Figure 3-13: Publishing Wizard Complete

- 11.** Click **Finish**.

3.2 Configuring the "Route" on Lync Server 2013

The procedure below describes how to configure a "Route" on the Lync Server 2013 and to associate it with the E-SBC PSTN gateway.

➤ **To configure the "route" on Lync Server 2013:**

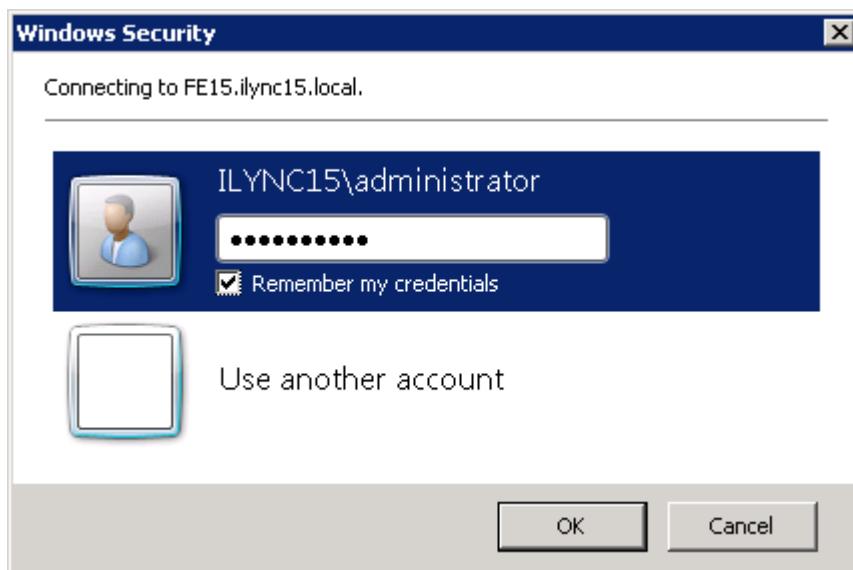

1. Start the Microsoft Lync Server 2013 Control Panel (**Start > All Programs > Microsoft Lync Server 2013 > Lync Server Control Panel**), as shown below:

Figure 3-14: Opening the Lync Server Control Panel

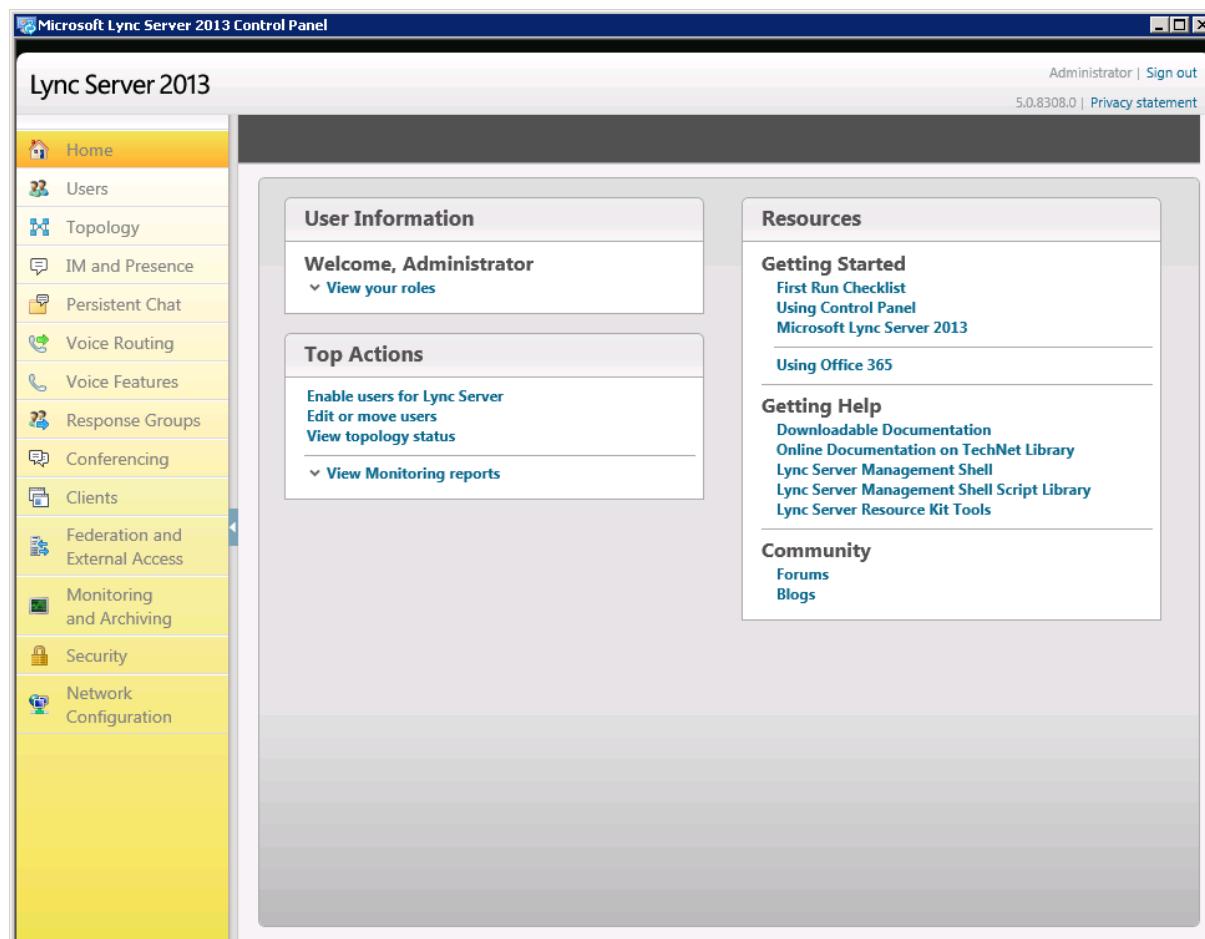

2. You are prompted to enter your login credentials:

Figure 3-15: Lync Server Credentials

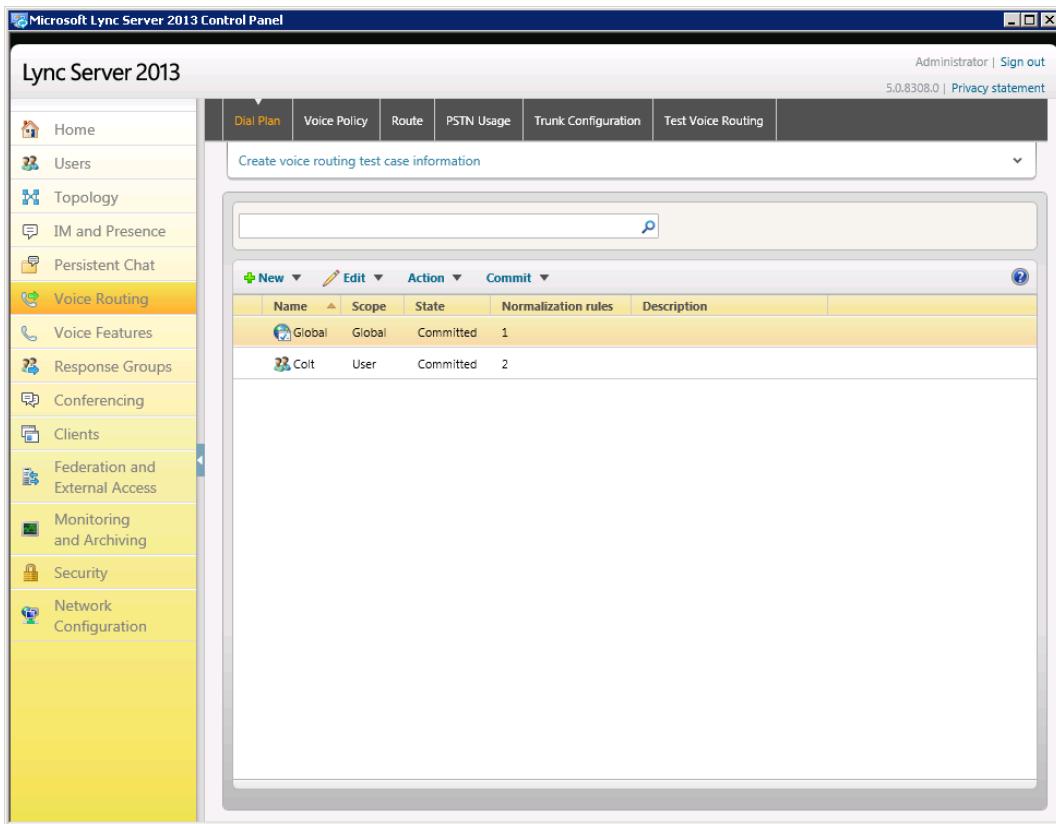

3. Enter your domain username and password, and then click **OK**; the Microsoft Lync Server 2013 Control Panel is displayed:

Figure 3-16: Microsoft Lync Server 2013 Control Panel

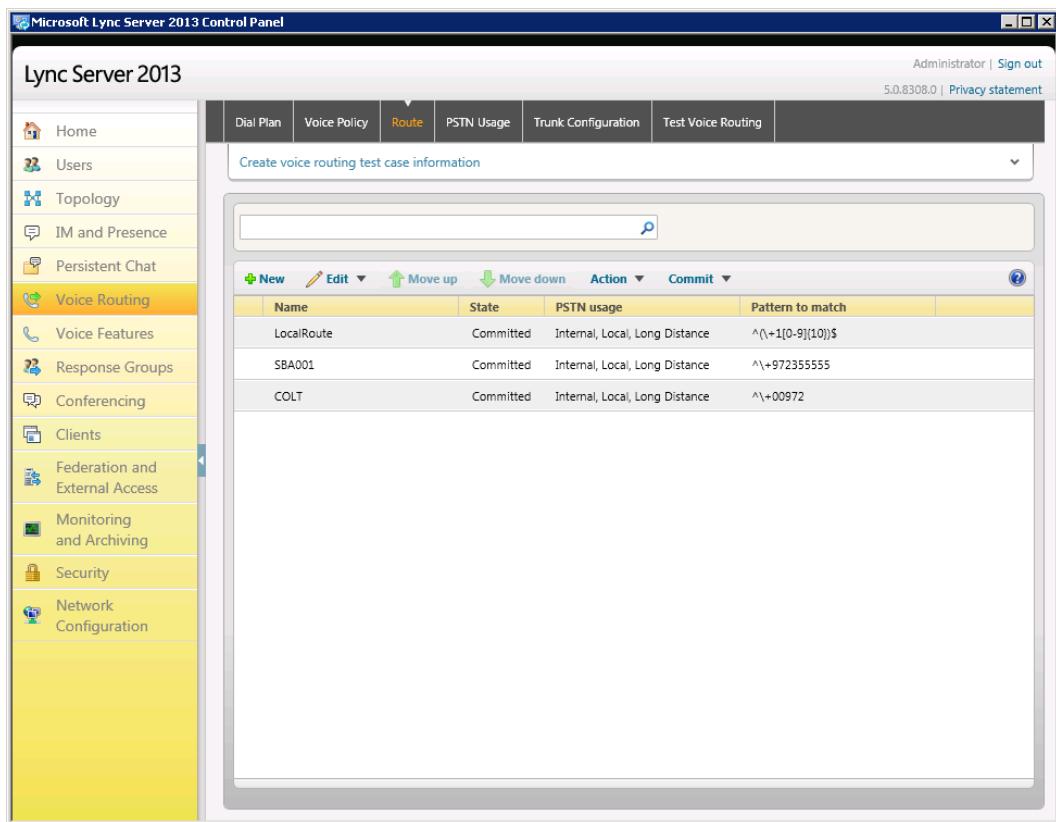

4. In the left navigation pane, select **Voice Routing**.

Figure 3-17: Voice Routing Page

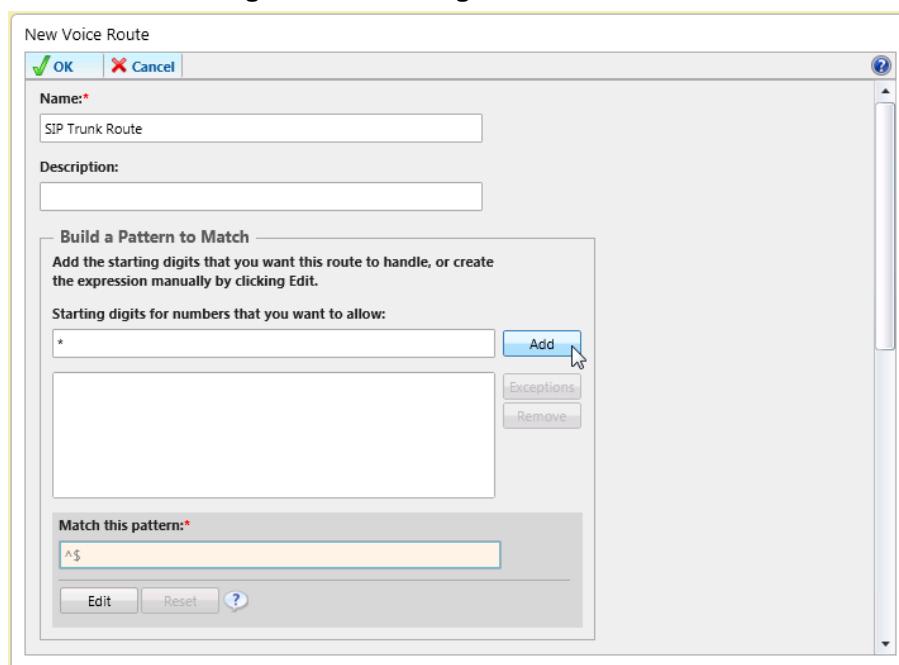

5. In the Voice Routing page, select the **Route** tab.

Figure 3-18: Route Tab

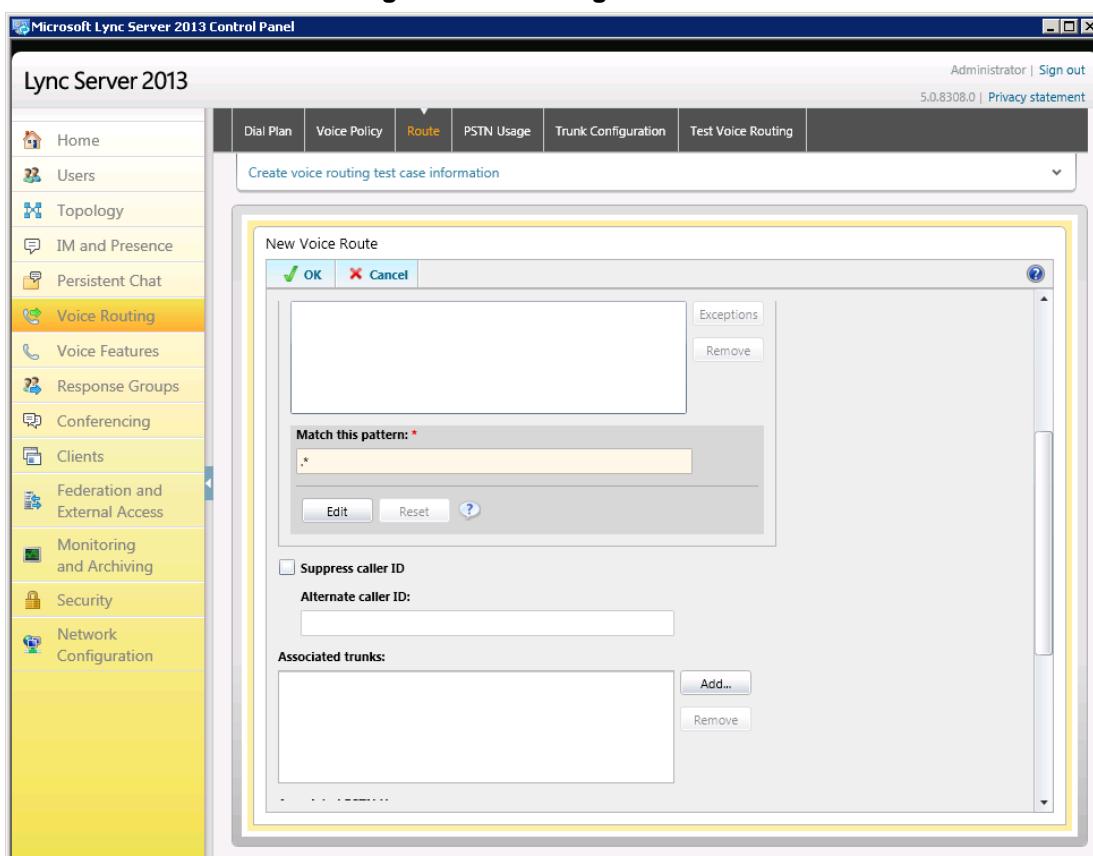

6. Click **New**; the New Voice Route page appears:

Figure 3-19: Adding New Voice Route

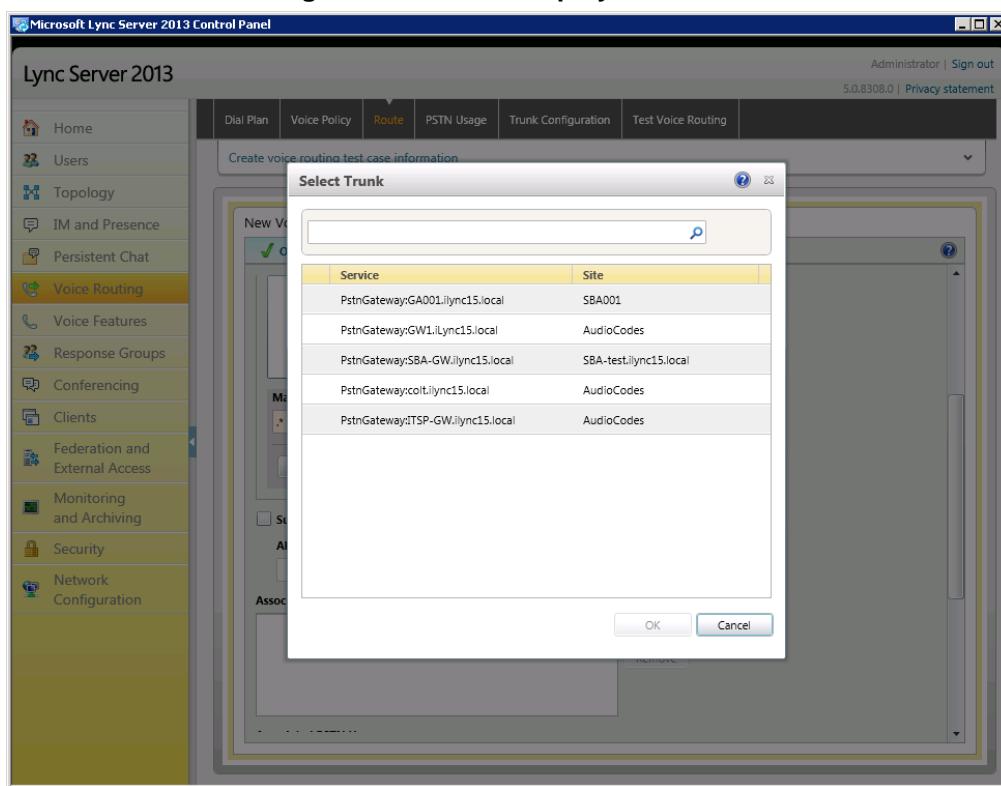

7. In the 'Name' field, enter a name for this route (e.g., **SIP Trunk Route**).
8. In the 'Starting digits for numbers that you want to allow' field, enter the starting digits you want this route to handle (e.g., * to match all numbers), and then click **Add**.

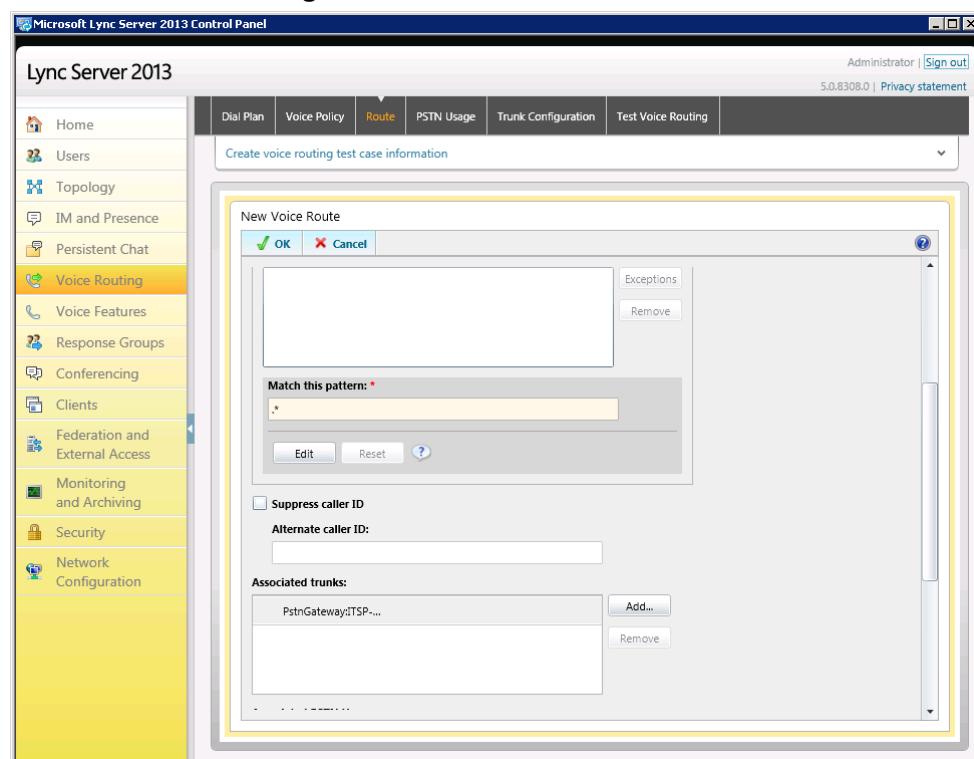

Figure 3-20: Adding New Trunk

9. Associate the route with the E-SBC Trunk that you created:
- Under the 'Associated Trunks' group, click **Add**; a list of all the deployed gateways is displayed:

Figure 3-21: List of Deployed Trunks

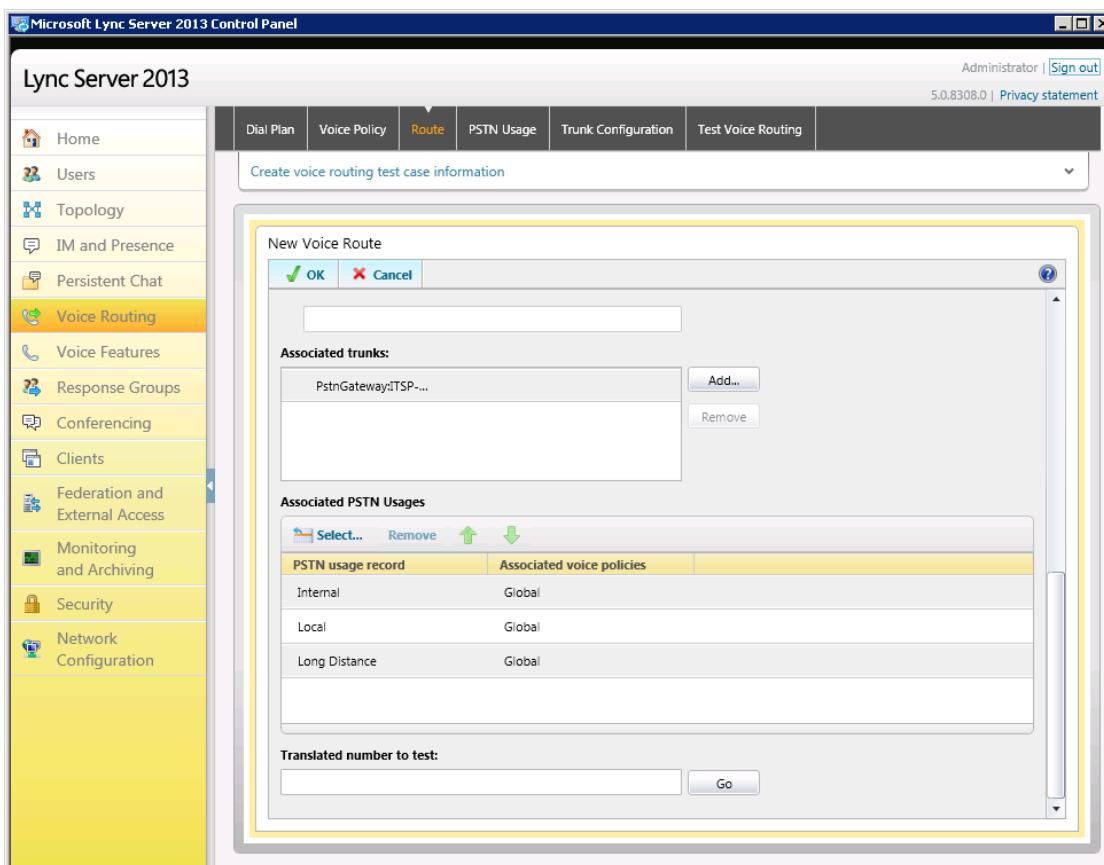

- Select the E-SBC Trunk you created, and then click **OK**; the trunk is added to the 'Associated Trunks' group list:

Figure 3-22: Selected E-SBC Trunk

10. Associate a PSTN Usage to this route:

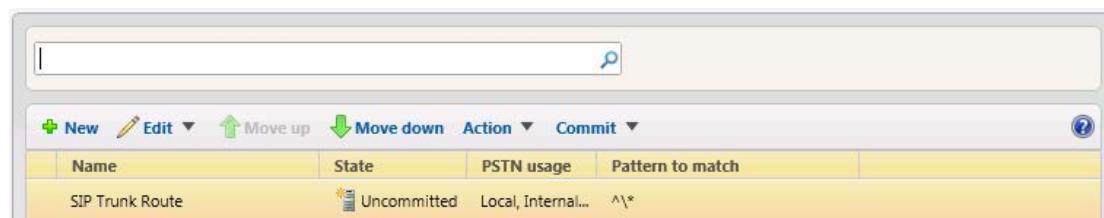

- Under the 'Associated PSTN Usages' group, click **Select** and then add the associated PSTN Usage.

Figure 3-23: Associating PSTN Usage to Route

- Click **OK** (located on the top of the New Voice Route page); the New Voice Route (Uncommitted) is displayed:

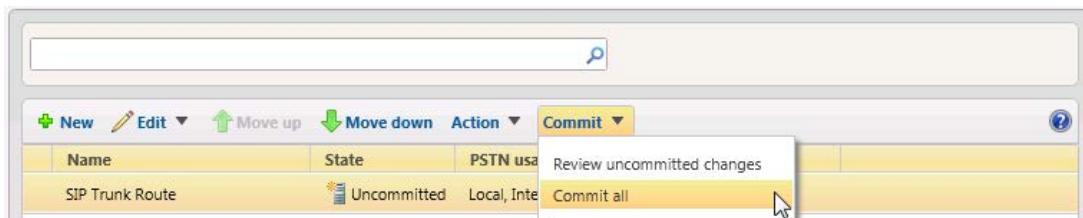

Figure 3-24: Confirmation of New Voice Route

This screenshot shows a table titled 'SIP Trunk Route' within the Microsoft Lync Server 2013 Control Panel. The table has four columns: 'Name', 'State', 'PSTN usage', and 'Pattern to match'. A single row is present in the table, representing the newly created route. The 'Name' column shows 'SIP Trunk Route', the 'State' column shows 'Uncommitted', the 'PSTN usage' column shows 'Local, Internal...', and the 'Pattern to match' column shows '^*'. The table includes standard navigation buttons like 'New', 'Edit', 'Move up', 'Move down', 'Action', and 'Commit'.

12. From the **Commit** drop-down list, choose **Commit all**, as shown below:

Figure 3-25: Committing Voice Routes

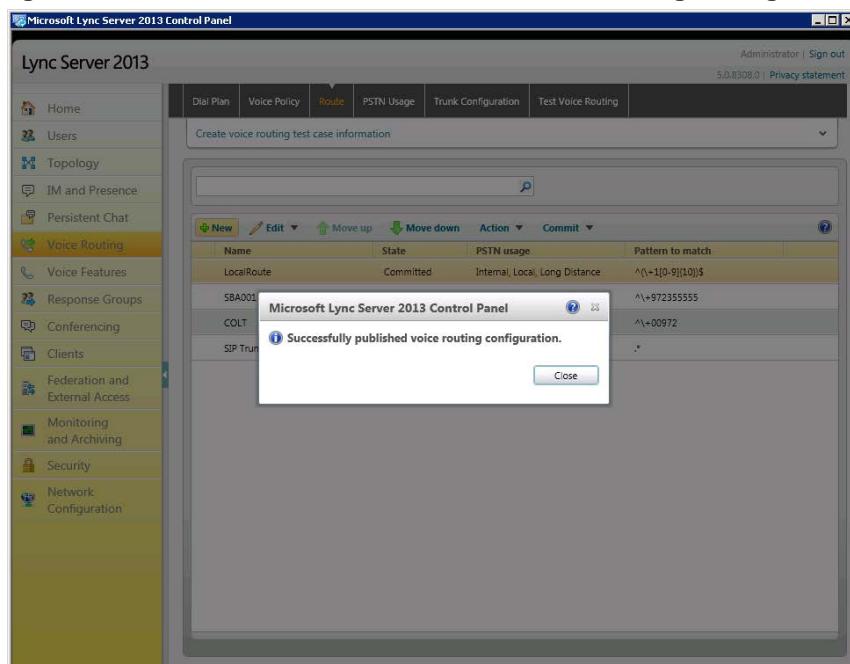

The Uncommitted Voice Configuration Settings page appears:

Figure 3-26: Uncommitted Voice Configuration Settings

Identity	Action	New value (pattern to match)	Old value (pattern to match)
SIP Trunk Route	Added	^*	.

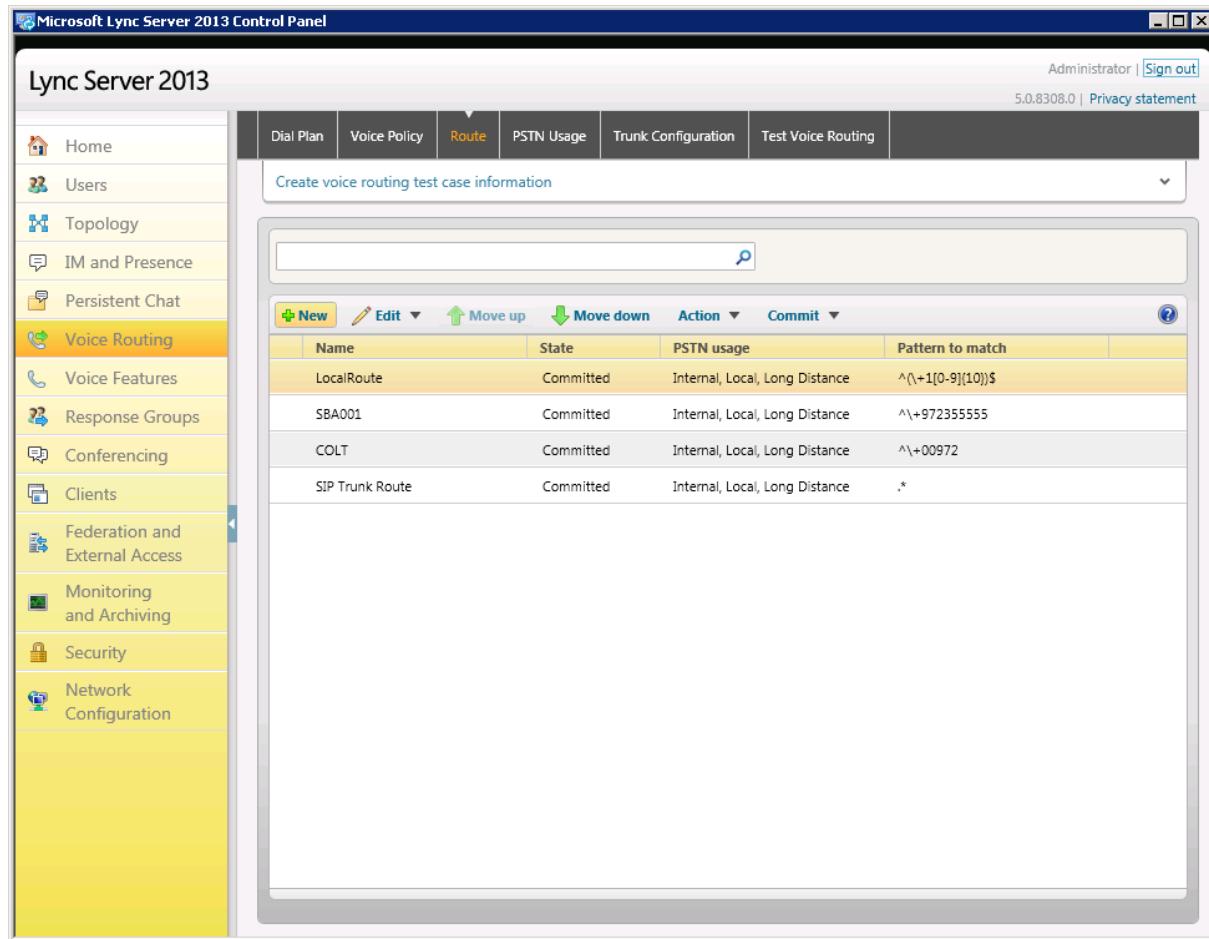

13. Click **Commit**; a message is displayed confirming a successful voice routing configuration, as shown below:

Figure 3-27: Confirmation of Successful Voice Routing Configuration

- 14.** Click **Close**; the new committed Route is displayed in the Voice Routing page, as shown below:

Figure 3-28: Voice Routing Screen Displaying Committed Routes

Name	State	PSTN usage	Pattern to match
LocalRoute	Committed	Internal, Local, Long Distance	^(\\+1[0-9]{10})\$
SBA001	Committed	Internal, Local, Long Distance	^\\+972355555
COLT	Committed	Internal, Local, Long Distance	^\\+00972
SIP Trunk Route	Committed	Internal, Local, Long Distance	*

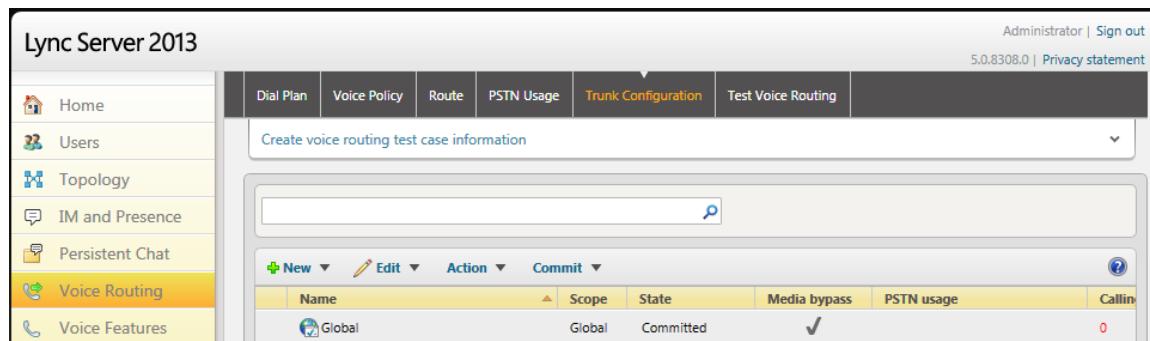

- 15.** For ITSPs that implement a call identifier, continue with the following steps:

Note: The SIP History-Info header provides a method to verify the identity (ID) of the call forwarder (i.e., the Lync user number). This ID is required by Virgin Media SIP Trunk in the P-Asserted-Identity header. Using IP Profile configuration (see Section 4.6 on page 50), the device adds this ID to the P-Asserted-Identity header in the sent INVITE message.

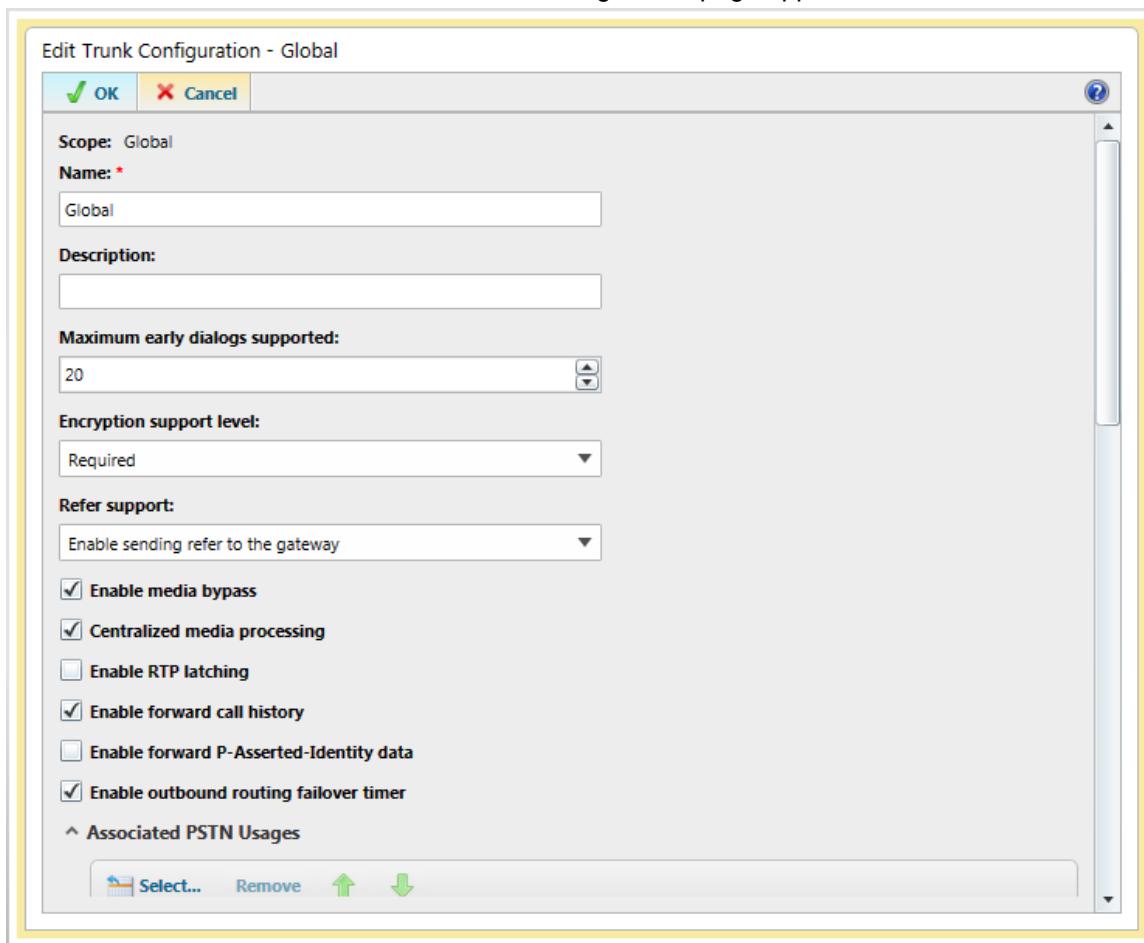

- a.** In the Voice Routing page, select the **Trunk Configuration** tab. Note that you can add and modify trunk configuration by site or by pool.

Figure 3-29: Voice Routing Screen – Trunk Configuration Tab

Name	Scope	State	Media bypass	PSTN usage	Calling line identification
Global	Global	Committed	✓		0

- b. Click **Edit**; the Edit Trunk Configuration page appears:

- c. Select the **Enable forward call history** check box, and then click **OK**.
d. Repeat Steps 11 through 13 to commit your settings.

This page is intentionally left blank.

4 Configuring AudioCodes E-SBC

This chapter provides step-by-step procedures on how to configure AudioCodes E-SBC for interworking between Microsoft Lync Server 2013 and the Virgin Media SIP Trunk. These configuration procedures are based on the interoperability test topology described in Section 2.4 on page 12, and includes the following main areas:

- E-SBC WAN interface - Virgin Media SIP Trunking environment
- E-SBC LAN interface - Lync Server 2013 environment

This configuration is done using the E-SBC's embedded Web server (hereafter, referred to as *Web interface*).

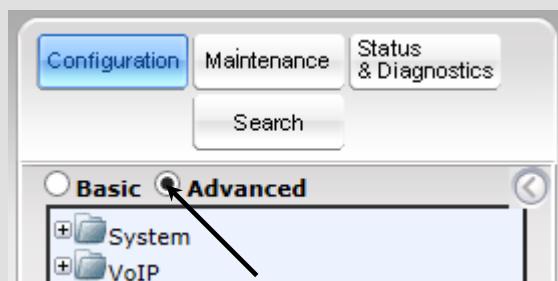

Notes:

- For implementing Microsoft Lync and Virgin Media SIP Trunk based on the configuration described in this section, AudioCodes E-SBC must be installed with a Software License Key that includes the following software features:
 - ✓ Microsoft
 - ✓ SBC
 - ✓ Security
 - ✓ DSP
 - ✓ RTP
 - ✓ SIP

For more information about the Software License Key, contact your AudioCodes sales representative.

- The scope of this document does not cover security aspects for connecting the SIP Trunk to the Microsoft Lync environment. Security measures should be implemented in accordance with your organization's security policies. For basic security guidelines, refer to the Recommended Security Guidelines document.
- Before you begin configuring the E-SBC, ensure that the E-SBC's Web interface Navigation tree is in Full-menu display mode. To do this, select the Full option, as shown below:

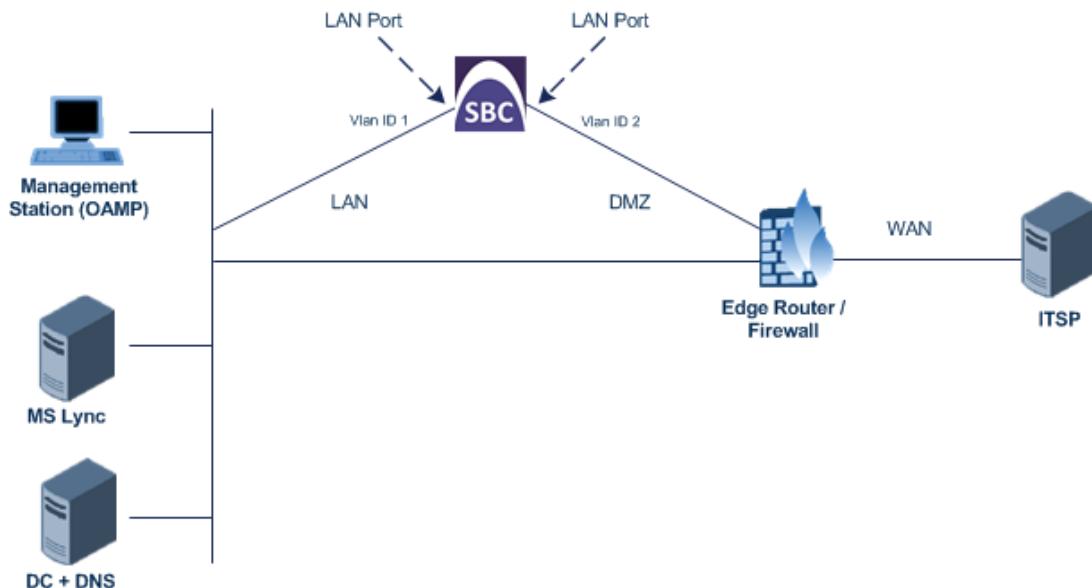

- When the E-SBC is reset, the Navigation tree reverts to Basic-menu display.

4.1 Step 1: IP Network Interfaces Configuration

This step describes how to configure the E-SBC's IP network interfaces. There are several ways to deploy the E-SBC; however, this interoperability test topology employs the following deployment method:

- E-SBC interfaces with the following IP entities:
 - Lync servers, located on the LAN
 - Virgin Media SIP Trunk, located on the WAN
- E-SBC connects to the WAN through a DMZ network
- Physical connection: The type of physical connection to the LAN depends on the method used to connect to the Enterprise's network. In the interoperability test topology, E-SBC connects to the LAN and WAN using dedicated LAN ports (i.e., two ports and two network cables are used).
- E-SBC also uses two logical network interfaces:
 - LAN (VLAN ID 1)
 - WAN (VLAN ID 2)

Figure 4-1: Network Interfaces in Interoperability Test Topology

4.1.1 Step 1a: Configure VLANs

This step describes how to define VLANs for each of the following interfaces:

- LAN VoIP (assigned the name "Voice")
- WAN VoIP (assigned the name "WANSP")

➤ **To configure the VLANs:**

1. Open the Ethernet Device Table page (**Configuration** tab > **VoIP** menu > **Network** > **Ethernet Device Table**).
2. There will be one existing row for VLAN ID 1 and underlying interface GROUP_1.
3. Add another VLAN ID 2 for the WAN side as follows:

Parameter	Value
Index	1
VLAN ID	2
Underlying Interface	GROUP_2 (Ethernet port group)
Name	vlan 2

Figure 4-2: Configured VLAN IDs in Ethernet Device Table

The screenshot shows a web-based configuration interface for the Ethernet Device Table. At the top, there is a header bar with the title 'Ethernet Device Table'. Below the header, there is a toolbar with a blue 'Add +' button. The main area is a table with four columns: 'Index', 'VLAN ID', 'Underlying Interface', and 'Name'. There are two rows of data in the table:

Index	VLAN ID	Underlying Interface	Name
0	1	GROUP_1	vlan 1
1	2	GROUP_2	vlan 2

At the bottom of the table, there are navigation controls: 'Page 1 of 1', 'Show 10 records per page', and 'View 1 - 2 of 2'.

4.1.2 Step 1b: Configure Network Interfaces

This step describes how to configure the IP network interfaces for each of the following interfaces:

- LAN VoIP (assigned the name "Voice")
- WAN VoIP (assigned the name "WANSP")

➤ **To configure the IP network interfaces:**

1. Open the IP Interfaces Table page (**Configuration** tab > **VoIP** menu > **Network** > **IP Interfaces Table**).
2. Modify the existing LAN network interface:
 - a. Select the 'Index' radio button of the **OAMP + Media + Control** table row, and then click **Edit**.
 - b. Configure the interface as follows:

Parameter	Value
IP Address	10.15.17.77 (IP address of E-SBC)
Prefix Length	16 (subnet mask in bits for 255.255.0.0)
Gateway	10.15.0.1
VLAN ID	1
Interface Name	Voice (arbitrary descriptive name)
Primary DNS Server IP Address	10.15.25.1
Underlying Device	vlan 1

3. Add a network interface for the WAN side:
 - a. Enter **1**, and then click **Add Index**.
 - b. Configure the interface as follows:

Parameter	Value
Application Type	Media + Control
IP Address	195.189.192.158 (WAN IP address)
Prefix Length	25 (for 255.255.255.128)
Gateway	195.189.192.129 (router's IP address)
VLAN ID	2
Interface Name	WANSP
Primary DNS Server IP Address	80.179.52.100
Secondary DNS Server IP Address	80.179.55.100
Underlying Device	vlan 2

4. Click **Apply, and then **Done**.**

The configured IP network interfaces are shown below:

Figure 4-3: Configured Network Interface in IP Interfaces Table

Interface Table									
Add +									
Index ▲	Application Type	Interface Mode	IP Address	Prefix Length	Default Gateway	Interface Name	Primary DNS	Secondary DNS	Underlying Device
0	OAMP + Media + IPv4 Manual		10.15.17.77	16	10.15.0.1	Voice	10.15.25.1	0.0.0.0	vlan 1
1	Media + Control	IPv4 Manual	195.189.192.15	25	195.189.192.12	WANSP	80.179.52.100	80.179.55.100	vlan 2

Page of 1 Show records per page View 1 - 2 of 2

4.1.3 Step 1c: Configure the Native VLAN ID

This step describes how to configure the Native VLAN ID for the LAN and WAN interfaces.

➤ **To configure the Native VLAN ID for the IP network interfaces:**

1. Open the Physical Ports Settings page (**Configuration** tab> **VoIP** menu > **Network > Physical Ports Table**).
2. For the **GROUP_1** member ports, set the 'Native Vlan' field to **1**. This VLAN is assigned to network interface "Voice".
3. For the **GROUP_2** member ports, set the 'Native Vlan' field to **2**. This VLAN is assigned to network interface "WANSP".

Figure 4-4: Configured Port Native VLAN

Physical Ports Settings							
Index :	Port	Mode	Native Vlan	Speed&Duplex	Description	Group Member	Group Status
0	GE_4_1	Enable	1	Auto Negotiation	User Port #0	GROUP_1	Active
1	GE_4_2	Enable	1	Auto Negotiation	User Port #1	GROUP_1	Redundant
2	GE_4_3	Enable	2	Auto Negotiation	User Port #2	GROUP_2	Active
3	GE_4_4	Enable	2	Auto Negotiation	User Port #3	GROUP_2	Redundant

4.2 Step 2: Enable the SBC Application

This step describes how to enable the SBC application.

➤ **To enable the SBC application:**

1. Open the Applications Enabling page (**Configuration** tab > **VoIP** menu > **Applications Enabling** > **Applications Enabling**).

Figure 4-5: Enabling SBC Application

SBC Application	Disable
SBC Application	Enable
IP to IP Application	Disable

2. From the 'SBC Application' drop-down list, select **Enable**.
3. Click **Submit**.
4. Reset the E-SBC with a burn to flash for this setting to take effect (see Section 4.15 on page 87).

4.3 Step 3: Signaling Routing Domains Configuration

This step describes how to configure Signaling Routing Domains (SRD). The SRD represents a logical VoIP network. Each logical or physical connection requires an SRD, for example, if the E-SBC interfaces with both the LAN and WAN, a different SRD would be required for each one.

The SRD is composed of the following:

- **Media Realm:** Defines a UDP port range for RTP/SRTP (media) traffic on a specific logical IP network interface of the E-SBC.
- **SIP Interface:** Defines a listening port and type (UDP, TCP, or TLS) for SIP signaling traffic on a specific logical IP network interface of the E-SBC.

4.3.1 Step 3a: Configure Media Realms

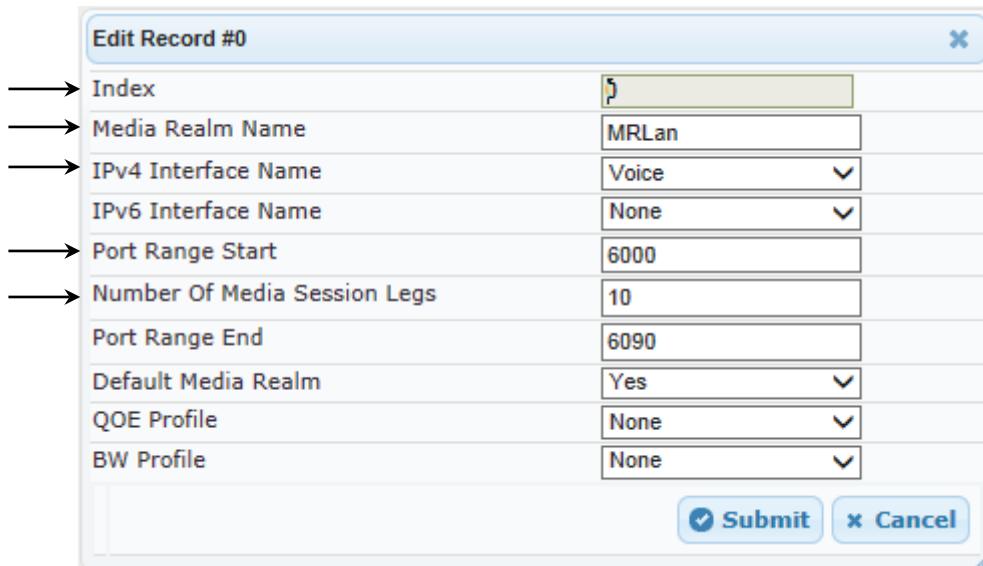

This step describes how to configure Media Realms. The simplest configuration is to create two Media Realms - one for internal (LAN) traffic and one for external (WAN) traffic.

➤ **To configure Media Realms:**

1. Open the Media Realm Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **Media Realm Table**).
2. Modify the existing Media Realm for LAN traffic:

Parameter	Value
Index	0
Media Realm Name	MRLan (descriptive name)
IPv4 Interface Name	Voice
Port Range Start	6000 (represents lowest UDP port number used for media on LAN)
Number of Media Session Legs	10 (media sessions assigned with port range)

Figure 4-6: Configuring Media Realm for LAN

The dialog box is titled "Edit Record #0". It contains the following fields:

Index	0
Media Realm Name	MRLan
IPv4 Interface Name	Voice
IPv6 Interface Name	None
Port Range Start	6000
Number Of Media Session Legs	10
Port Range End	6090
Default Media Realm	Yes
QOE Profile	None
BW Profile	None

At the bottom right are "Submit" and "Cancel" buttons.

3. Configure a Media Realm for WAN traffic:

Parameter	Value
Index	1
Media Realm Name	MRWan (arbitrary name)
IPv4 Interface Name	WANSP
Port Range Start	7000 (represents lowest UDP port number used for media on WAN)
Number of Media Session Legs	10 (media sessions assigned with port range)

Figure 4-7: Configuring Media Realm for WAN

Add Record	
Index	1
Media Realm Name	MRWan
IPv4 Interface Name	WANSP
IPv6 Interface Name	None
Port Range Start	7000
Number Of Media Session Legs	10
Port Range End	-1
Default Media Realm	No
QOE Profile	None
BW Profile	None
<input checked="" type="button"/> Submit <input type="button"/> Cancel	

The configured Media Realms are shown in the figure below:

Figure 4-8: Configured Media Realms in Media Realm Table

Media Realm Table			
Add +	Index	Media Realm Name	IPv4 Interface Name
	0	MRLan	Voice
	1	MRWan	WANSP
Page <input type="text"/> of 1 Show <input type="text"/> records per page View 1 - 2 of 2			

4.3.2 Step 3b: Configure SRDs

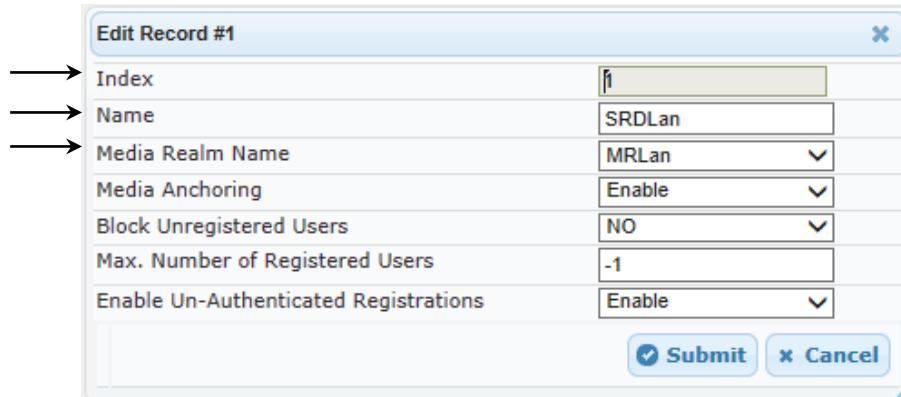

This step describes how to configure the SRDs.

➤ **To configure SRDs:**

1. Open the SRD Settings page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **SRD Table**).
2. Configure an SRD for the E-SBC's internal interface (toward the Lync Server 2013):

Parameter	Value
Index	1
Name	SRDLan (descriptive name for SRD)
Media Realm	MRLan (associates SRD with Media Realm)

Figure 4-9: Configuring LAN SRD

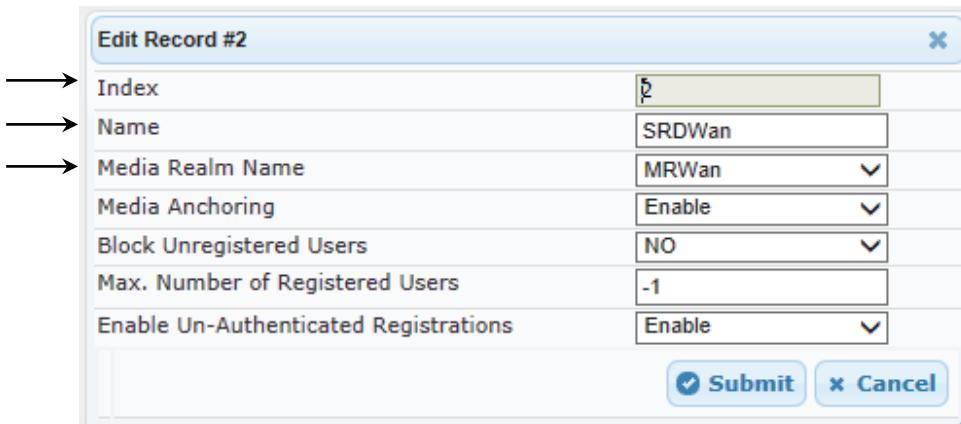

Edit Record #1	
Index	1
Name	SRDLan
Media Realm Name	MRLan
Media Anchoring	Enable
Block Unregistered Users	NO
Max. Number of Registered Users	-1
Enable Un-Authenticated Registrations	Enable
<input checked="" type="button"/> Submit <input type="button"/> Cancel	

3. Configure an SRD for the E-SBC's external interface (toward the Virgin Media SIP Trunk):

Parameter	Value
Index	2
Name	SRDWan
Media Realm	MRWan

Figure 4-10: Configuring WAN SRD

Edit Record #2	
Index	2
Name	SRDWan
Media Realm Name	MRWan
Media Anchoring	Enable
Block Unregistered Users	NO
Max. Number of Registered Users	-1
Enable Un-Authenticated Registrations	Enable
<input checked="" type="button"/> Submit <input type="button"/> Cancel	

4.3.3 Step 3c: Configure SIP Signaling Interfaces

This step describes how to configure SIP Interfaces. For the interoperability test topology, an internal and external SIP Interface must be configured for the E-SBC.

➤ **To configure SIP Interfaces:**

1. Open the SIP Interface Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **SIP Interface Table**).
2. Configure a SIP interface for the LAN:

Parameter	Value
Index	1
Interface Name	Lync (arbitrary descriptive name)
Network Interface	Voice
Application Type	SBC
TLS Port	5067
TCP and UDP	0
SRD	1

3. Configure a SIP interface for the WAN:

Parameter	Value
Index	2
Interface Name	Virginmedia (arbitrary descriptive name)
Network Interface	WANSP
Application Type	SBC
UDP Port	5060
TCP and TLS	0
SRD	2

The configured SIP Interfaces are shown in the figure below:

Figure 4-11: Configured SIP Interfaces in SIP Interface Table

SIP Interface Table							
<input type="button" value="Add +"/> <input type="button" value="Delete -"/>							
Index	SIP Interface Name	Network Interface	Application Type	UDP Port	TCP Port	TLS Port	SRD
1	Lync	Voice	SBC	0	0	5067	1
2	Virginmedia	WANSP	SBC	5060	0	0	2

4.4 Step 4: Configure Proxy Sets

This step describes how to configure Proxy Sets. The Proxy Set defines the destination address (IP address or FQDN) of the IP entity server. Proxy Sets can also be used to configure load balancing between multiple servers.

For the interoperability test topology, two Proxy Sets need to be configured for the following IP entities:

- Microsoft Lync Server 2013
- Virgin Media SIP Trunk A
- Virgin Media SIP Trunk B

These Proxy Sets will later be associated with IP Groups.

➤ **To configure Proxy Sets:**

1. Open the Proxy Sets Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **Proxy Sets Table**).
2. Configure a Proxy Set for Lync Server 2013:

Parameter	Value
Proxy Set ID	1
Proxy Address	FE15.ilync15.local:5067 (Lync Server 2013 IP address / FQDN and destination port)
Transport Type	TLS
Proxy Name	Lync (arbitrary descriptive name)
Enable Proxy Keep Alive	Using Options
Proxy Load Balancing Method	Round Robin
Is Proxy Hot Swap	Yes
SRD Index	1

Figure 4-12: Configuring Proxy Set for Microsoft Lync Server 2013

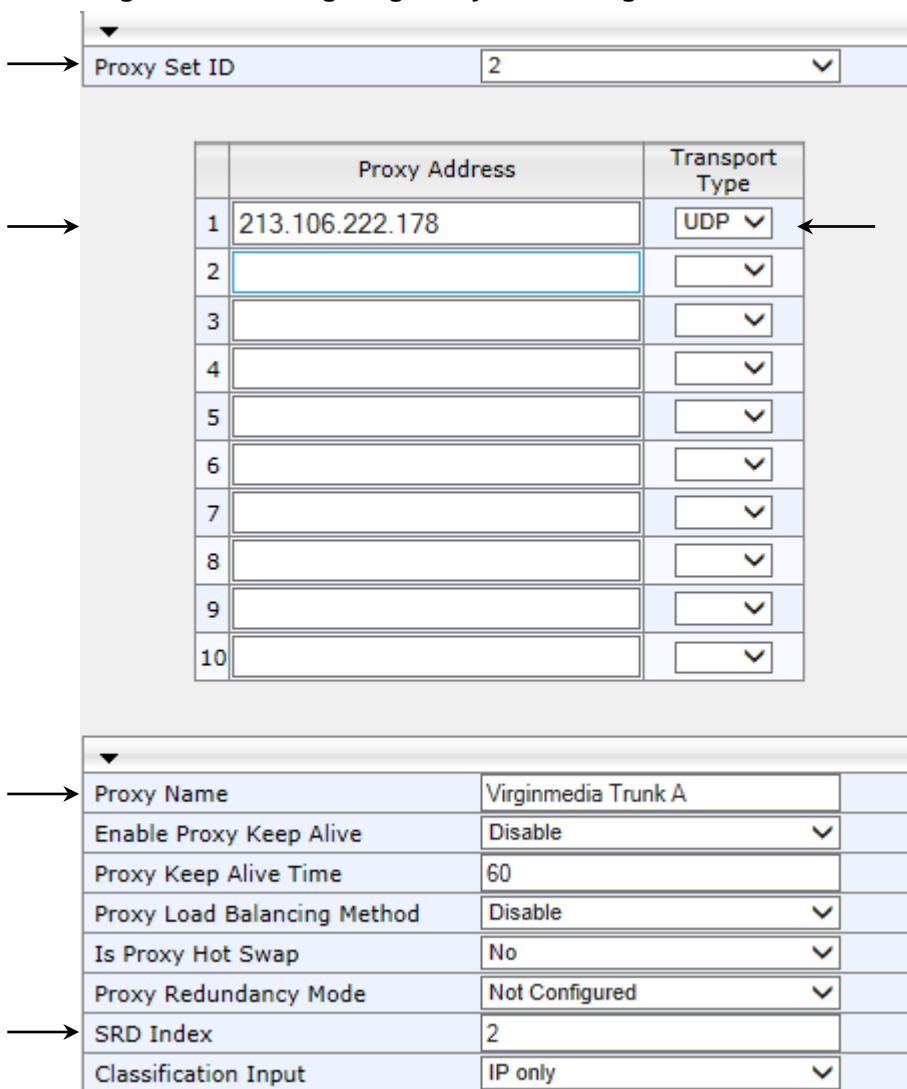

The screenshot shows the 'Proxy Set' configuration screen in the Microsoft Lync Server 2013 management console. The top section displays the 'Proxy Set ID' as 1. Below this is a table for configuring proxy addresses and their transport types. The table has two columns: 'Proxy Address' and 'Transport Type'. The first row contains the address 'FE15.ilync15.local:5067' and the transport type 'TLS'. The subsequent rows (2 through 5) are empty. The bottom section contains several configuration parameters:

Proxy Name	Lync
Enable Proxy Keep Alive	Using Options
Proxy Keep Alive Time	60
Proxy Load Balancing Method	Round Robin
Is Proxy Hot Swap	Yes
Proxy Redundancy Mode	Not Configured
SRD Index	1
Classification Input	IP only

3. Configure a Proxy Set for the Virgin Media SIP Trunk A:

Parameter	Value
Proxy Set ID	2
Proxy Address	213.106.222.178 (Virgin Media Trunk A IP address / FQDN and destination port)
Transport Type	UDP
Proxy Name	Virginmedia Trunk A (arbitrary descriptive name)
SRD Index	2 (enables classification by Proxy Set for SRD of IP Group belonging to Virgin Media SIP Trunk)

Figure 4-13: Configuring Proxy Set for Virgin Media SIP Trunk A

The figure shows three panels of a configuration interface. The top panel is a table for setting parameters. The middle panel is a table for defining proxy addresses. The bottom panel is a table for configuring proxy settings.

Top Panel (Parameter Table):

Proxy Set ID	2
--------------	---

Middle Panel (Proxy Address Table):

	Proxy Address	Transport Type
1	213.106.222.178	UDP
2		
3		
4		
5		
6		
7		
8		
9		
10		

Bottom Panel (Proxy Settings Table):

Proxy Name	Virginmedia Trunk A
Enable Proxy Keep Alive	Disable
Proxy Keep Alive Time	60
Proxy Load Balancing Method	Disable
Is Proxy Hot Swap	No
Proxy Redundancy Mode	Not Configured
SRD Index	2
Classification Input	IP only

4. Configure a Proxy Set for the Virgin Media SIP Trunk B:

Parameter	Value
Proxy Set ID	2
Proxy Address	82.14.171.226 (Virgin Media Trunk B IP address / FQDN and destination port)
Transport Type	UDP
Proxy Name	Virginmedia Trunk B (arbitrary descriptive name)
SRD Index	2 (enables classification by Proxy Set for SRD of IP Group belonging to Virgin Media SIP Trunk)

Figure 4-14: Configuring Proxy Set for Virgin Media SIP Trunk B

Proxy Set ID	3
Proxy Address	82.14.171.226
Transport Type	UDP
1	82.14.171.226
2	
3	
4	
5	
6	
7	
8	
9	
10	

Proxy Name	Virginmedia Trunk B
Enable Proxy Keep Alive	Disable
Proxy Keep Alive Time	60
Proxy Load Balancing Method	Disable
Is Proxy Hot Swap	No
Proxy Redundancy Mode	Not Configured
SRD Index	2
Classification Input	IP only

5. Reset the E-SBC with a burn to flash for these settings to take effect (see Section 4.15 on page 87).

4.5 Step 5: Configure IP Groups

This step describes how to configure IP Groups. The IP Group represents an IP entity on the network with which the E-SBC communicates. This can be a server (e.g., IP PBX or ITSP) or it can be a group of users (e.g., LAN IP phones). For servers, the IP Group is typically used to define the server's IP address by associating it with a Proxy Set. A typical deployment consists of multiple IP Groups associated with the same SRD. For example, you can have two LAN IP PBXs sharing the same SRD, and two ITSPs / SIP Trunks sharing the same SRD. Once IP Groups are configured, they are used to configure IP-to-IP routing rules for denoting source and destination of the call.

In this interoperability test topology, IP Groups must be configured for the following IP entities:

- Lync Server 2013 (Mediation Server) located on the LAN
- Virgin Media SIP Trunks A and B located on the WAN

➤ **To configure IP Groups:**

1. Open the IP Group Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **IP Group Table**).
2. Configure an IP Group for the Lync Server 2013 Mediation Server.

Parameter	Value
Index	1
Type	Server
Description	Lync (arbitrary descriptive name)
Proxy Set ID	1
SIP Group Name	Virginmedia (according to ITSP requirement)
SRD	1
Media Realm Name	MRLan
IP Profile ID	1

3. Configure an IP Group for the Virgin Media SIP Trunk A.

Parameter	Value
Index	2
Type	Server
Description	Virginmedia Trunk A (arbitrary descriptive name)
Proxy Set ID	2
SIP Group Name	213.106.222.178 (according to ITSP requirement)
SRD	2
Media Realm Name	MRWan
IP Profile ID	2

4. Configure an IP Group for the Virgin Media SIP Trunk B.

Parameter	Value
Index	3
Type	Server
Description	Virginmedia Trunk B (arbitrary descriptive name)
Proxy Set ID	3
SIP Group Name	82.14.171.226 (according to ITSP requirement)
SRD	2
Media Realm Name	MRWan
IP Profile ID	2

The configured IP Groups are shown in the figure below:

Figure 4-15: Configured IP Groups in IP Group Table

▼ IP Group Table									
Add +									
Index	Type	Description	Proxy Set ID	SIP Group Name :	Contact User	SIP Re-Routing Mode	Always Use Route Table	SRD	
1	Server	Lync	1	213.106.222.178		Not Configured	No	1	
2	Server	Virginmedia Trunk A	2	213.106.222.178		Not Configured	No	2	
3	Server	Virginmedia Trunk B	3	82.14.171.226		Not Configured	No	2	

Page of 1 Show records per page View 1 - 3 of 3

4.6 Step 6: Configure IP Profiles

This step describes how to configure IP Profiles. The IP Profile defines a set of call capabilities relating to signaling (e.g., SIP message terminations such as REFER) and media (e.g., coder and transcoding method).

In this interoperability test topology, IP Profiles need to be configured for the following IP entities:

- Microsoft Lync Server 2013 - to operate in secure mode using SRTP and TLS
- Virgin Media SIP trunk - to operate in non-secure mode using RTP and UDP

Note that the IP Profiles were assigned to these entities (i.e., IP Groups) in the previous step (see Section 4.5 on page 48).

➤ **To configure IP Profiles:**

1. Open the IP Profile Settings page (**Configuration** tab > **VoIP > Coders and Profiles** > **IP Profile Settings**).
2. Click **Add**.
3. Click the **Common** tab, and then configure the parameters as follows:

Parameter	Value
Index	1
Profile Name	Lync (arbitrary descriptive name)
Symmetric MKI	Enable
MKI Size	1
Reset SRTP State Upon Re-key	Enable
Generate SRTP keys mode:	Always

Figure 4-16: Configuring IP Profile for Lync Server 2013 – Common Tab

Common		GW	SBC
Index	1		
Profile Name	Lync		
Profile Preference	1		
Dynamic Jitter Buffer Minimum Delay [msec]	10		
Dynamic Jitter Buffer Optimization Factor	10		
RTP IP DiffServ	46		
Signaling DiffServ	40		
Silence Suppression	Disable	▼	
RTP Redundancy Depth	0		
Echo Canceler	Line	▼	
Disconnect on Broken Connection	Yes	▼	
Input Gain (-32 to 31 dB)	0		
Voice Volume (-32 to 31 dB)	0		
Media IP Version Preference	Only IPv4	▼	
Symmetric MKI	Enable	▼	
MKI Size	1		
Reset SRTP Upon Re-key	Enable	▼	
Generate SRTP keys mode	Always	▼	
<input checked="" type="button"/> Submit <input type="button"/> Cancel			

4. Click the **SBC** tab, and then configure the parameters as follows:

Parameter	Value
Allowed Media Types	audio (required, as Lync Server 2013 does not support media type m=image, which sent by Virgin Media)
SBC Media Security Behavior	SRTP
Remote Update Support	Supported Only After Connect
Remote Re-INVITE Support	Supported Only With SDP
Remote Delayed Offer Support	Not Supported
Remote REFER Behavior	Handle Locally (required, as Lync Server 2013 does not support receipt of SIP REFER)
Remote 3xx Behavior	Handle Locally (required, as Lync Server 2013 does not support receipt of SIP 3xx responses)
Enforce MKI Size	Enforce
Remote Early Media RTP Behavior	Delayed (required, as Lync Server 2013 does not send RTP immediately to remote side when it sends a SIP 18x response)
Remote Hold Format	Inactive (required, as Lync Server 2013 does not support hold format a=inactive with IP 0.0.0.0, which sent by Virgin Media)
SDP Ptime Answer	Preferred Value
Preferred PTime	20 (required as Lync Server 2013 always sends PTime = 20)

Figure 4-17: Configuring IP Profile for Lync Server 2013 – SBC Tab

SBC

Remote Renegotiate on Fax Detection	Don't Care
<input checked="" type="button"/> Submit <input type="button"/> Cancel	

5. Configure an IP Profile for the Virgin Media SIP Trunks:
6. Click **Add**.
7. Click the **Common** tab, and then configure the parameters as follows:

Parameter	Value
Index	2
Profile Name	Virginmedia (arbitrary descriptive name)

Figure 4-18: Configuring IP Profile for Virgin Media SIP Trunk – Common Tab

The screenshot shows the 'Common' tab selected in a configuration interface. The form contains the following parameter-value pairs:

Index	2
Profile Name	Virginmedia
Profile Preference	1
Dynamic Jitter Buffer Minimum Delay [msec]	10
Dynamic Jitter Buffer Optimization Factor	10
RTP IP DiffServ	46
Signaling DiffServ	40
Silence Suppression	Disable
RTP Redundancy Depth	0
Echo Canceler	Line
Disconnect on Broken Connection	Yes
Input Gain (-32 to 31 dB)	0
Voice Volume (-32 to 31 dB)	0
Media IP Version Preference	Only IPv4
Symmetric MKI	Disable
MKI Size	0
Reset SRTP Upon Re-key	Disable
Generate SRTP keys mode	Only If Required
Jitter Buffer Max Delay [msec]	300

At the bottom right are two buttons: **Submit** and **Cancel**.

8. Click the **SBC** tab, and then configure the parameters as follows:

Parameter	Value
Profile ID	2
Allowed Coders Group ID	Coders Group 2
Allowed Coders Mode	Restrict and Preference (Re-arranges the order of the coders in the SDP according to their order of appearance in the Allowed Coders Group list)
SBC Media Security Behavior	RTP
P-Asserted-Identity	Add (required for anonymous calls)
Remote REFER Behavior	Handle Locally (E-SBC handles / terminates incoming REFER requests instead of forwarding them to SIP Trunk)
Remote Hold Format	Send Only (required, as Virgin Media work in Send Only mode)
SDP Ptime Answer	Preferred Value
Preferred PTime	10 (required according Virgin Media request)

<input checked="" type="button"/> Submit <input type="button"/> Cancel				

4.7 Step 7: Configure Coders

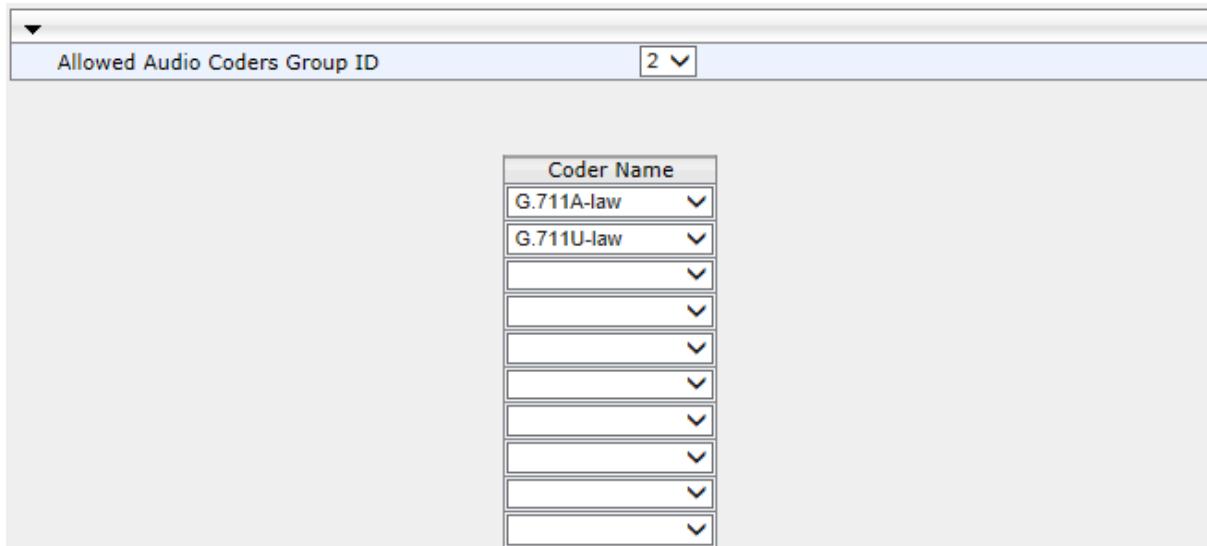

The procedure below describes how to configure an Allowed Coders Group to ensure that voice sent to the Virgin Media SIP Trunks uses only the G.711 coders, where G.711A-law is preferred (proposed first). Note that this Allowed Coders Group ID was assigned to the IP Profile belonging to the Virgin Media SIP Trunks in the previous step (see Section 4.6 on page 50).

➤ **To set a preferred coder for the Virgin Media SIP Trunk:**

1. Open the Allowed Coders Group page (**Configuration** tab > **VoIP** menu > **SBC** > **Allowed Coders Group**).
2. Configure an Allowed Coder as follows:

Parameter	Value
Allowed Coders Group ID	2
Coder Name	G.711A-law
Coder Name	G.711U-law

Figure 4-20: Configuring Allowed Coders Group for Virgin Media SIP Trunk

4.8 Step 8: SIP TLS Connection Configuration

This section describes how to configure the E-SBC for using a TLS connection with the Lync Server 2013 Mediation Server. This is essential for a secure SIP TLS connection.

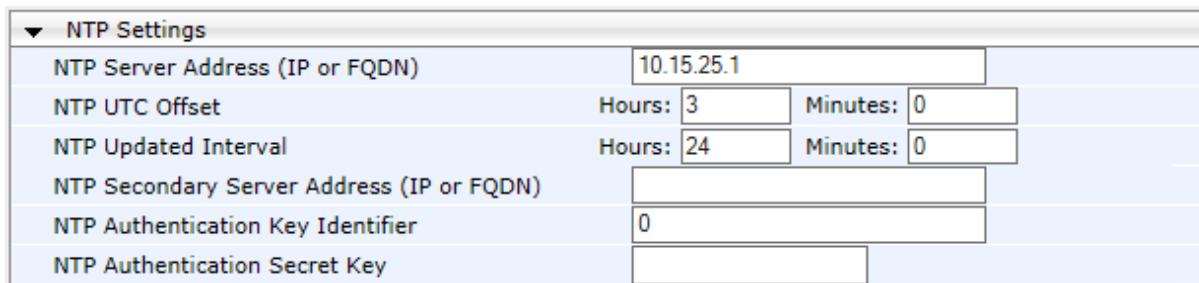

4.8.1 Step 8a: Configure the NTP Server Address

This step describes how to configure the NTP server's IP address. It is recommended to implement an NTP server (Microsoft NTP server or a third-party server) to ensure that the E-SBC receives the accurate and current date and time. This is necessary for validating certificates of remote parties.

➤ **To configure the NTP server address:**

1. Open the Application Settings page (**Configuration** tab > **System** > **Application Settings**).
2. In the 'NTP Server IP Address' field, enter the IP address of the NTP server (e.g., **10.15.25.1**).

Figure 4-21: Configuring NTP Server Address

NTP Settings	
NTP Server Address (IP or FQDN)	10.15.25.1
NTP UTC Offset	Hours: 3 Minutes: 0
NTP Updated Interval	Hours: 24 Minutes: 0
NTP Secondary Server Address (IP or FQDN)	
NTP Authentication Key Identifier	0
NTP Authentication Secret Key	

3. Click **Submit**.

4.8.2 Step 8b: Configure a Certificate

This step describes how to exchange a certificate with Microsoft Certificate Authority (CA). The certificate is used by the E-SBC to authenticate the connection with Lync Server 2013.

The procedure involves the following main steps:

- a. Generating a Certificate Signing Request (CSR)
- b. Requesting Device Certificate from CA
- c. Obtaining Trusted Root Certificate from CA
- d. Deploying Device and Trusted Root Certificates on E-SBC

➤ **To configure a certificate:**

1. Open the Certificates page (**Configuration tab > System > Certificates**).

Figure 4-22: Certificates Page - Creating CSR

Certificate Signing Request	
Subject Name [CN]	ITSP-GW.ilync15.local
Organizational Unit [OU] (optional)	
Company name [O] (optional)	
Locality or city name [L] (optional)	
State [ST] (optional)	
Country code [C] (optional)	
Create CSR	

After creating the CSR, copy the text below (including the BEGIN/END lines) and send it to your Certification Authority for signing.

```
-----BEGIN CERTIFICATE REQUEST-----
MIIBXzCBByQIBADAgMR4wHAYDVQQDExVJVFNQLUdXLm1seW5jMTUubG9jYWwwg28w
DQYJKoZIhvvcNAQEBBQADgY0AMIGJAoGBAKkobC9QmE0XA0vaTrkioon0LVrwNsC1

8z8hOCZXV/E4MrR2s8bYb6bxeteAXs+VwxgRObb4pSFFGLc82+dZUcODAB0wZFv
nxSEcPACKnZittF/GgW+A4AoMQ==
-----END CERTIFICATE REQUEST-----
```

2. In the 'Subject Name' field, enter the media gateway name (e.g., **ITSP-GW.ilync15.local**).

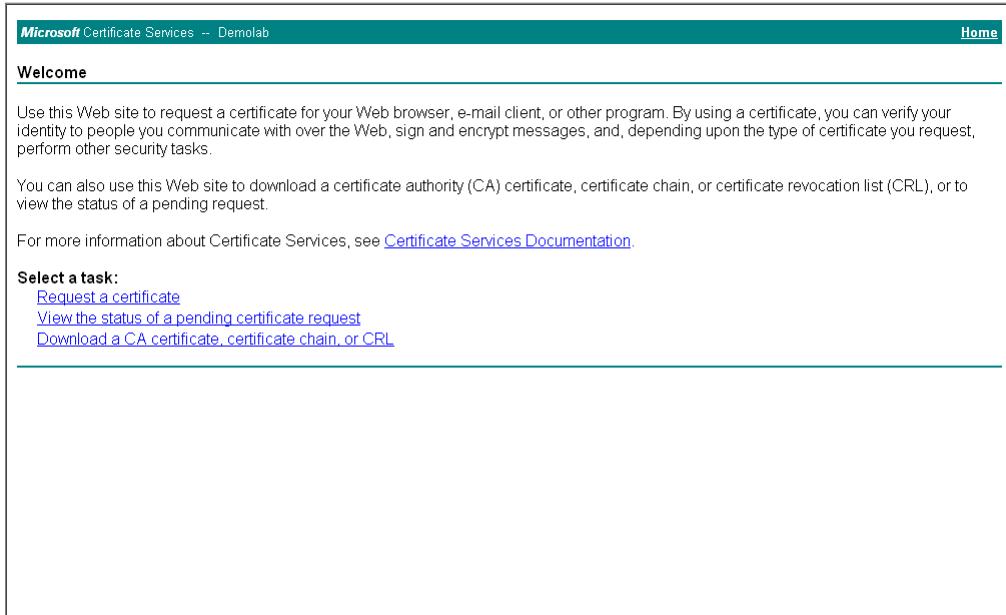

Note: The value entered in this field must be identical to the gateway name configured in the Topology Builder for Lync Server 2013 (see Section 3.1 on page 15).

3. Click **Create CSR**; a certificate request is generated.
4. Copy the CSR from the line "----BEGIN CERTIFICATE" to "END CERTIFICATE REQUEST----" to a text file (such as Notepad), and then save it to a folder on your computer with the file name, *certreq.txt*.

5. Open a Web browser and navigate to the Microsoft Certificates Services Web site at <http://<certificate server>/CertSrv>.

Figure 4-23: Microsoft Certificate Services Web Page

Welcome

Use this Web site to request a certificate for your Web browser, e-mail client, or other program. By using a certificate, you can verify your identity to people you communicate with over the Web, sign and encrypt messages, and, depending upon the type of certificate you request, perform other security tasks.

You can also use this Web site to download a certificate authority (CA) certificate, certificate chain, or certificate revocation list (CRL), or to view the status of a pending request.

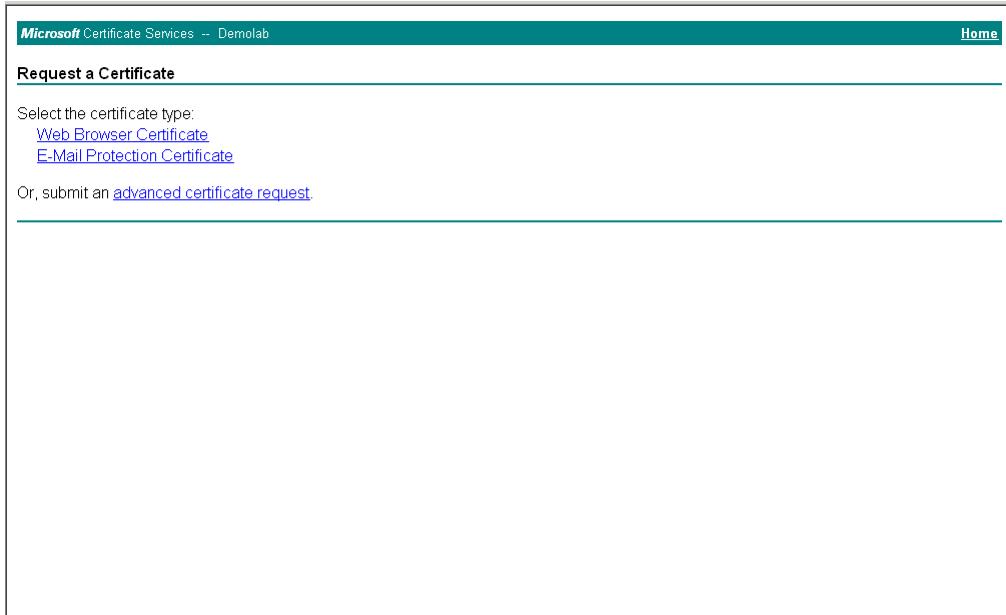

For more information about Certificate Services, see [Certificate Services Documentation](#).

Select a task:

[Request a certificate](#)
[View the status of a pending certificate request](#)
[Download a CA certificate, certificate chain, or CRL](#)

6. Click Request a certificate.

Figure 4-24: Request a Certificate Page

Request a Certificate

Select the certificate type:

[Web Browser Certificate](#)
[E-Mail Protection Certificate](#)

Or, submit an [advanced certificate request](#).

7. Click **advanced certificate request**, and then click **Next**.

Figure 4-25: Advanced Certificate Request Page

The policy of the CA determines the types of certificates you can request. Click one of the following options to:

[Create and submit a request to this CA.](#)
[Submit a certificate request by using a base-64-encoded CMC or PKCS #10 file, or submit a renewal request by using a base-64-encoded PKCS #7 file.](#)

8. Click **Submit a certificate request ...**, and then click **Next**.

Figure 4-26: Submit a Certificate Request or Renewal Request Page

To submit a saved request to the CA, paste a base-64-encoded CMC or PKCS #10 certificate request or PKCS #7 renewal request generated by an external source (such as a Web server) in the Saved Request box.

Saved Request:
Base-64-encoded certificate request (CMC or PKCS #10 or PKCS #7):

```
A8jxeP05ymyfbknfx+zEusB8zSh4JgzbeNxuyKk1
rr4ootrnsPOCawEAAAQAAQGCSqGSIb3DQEBBAAU
InkMlkx@xNggsalgolRmucht2Bo2m4gEcOgJPT8ok
9f3m8c4Bj8ib+R5+YI+Ost57xT9D2XNg5Yp4G+OB
vnQuXOUUX6BzVBT71aC83HcA
-----END CERTIFICATE REQUEST-----
```

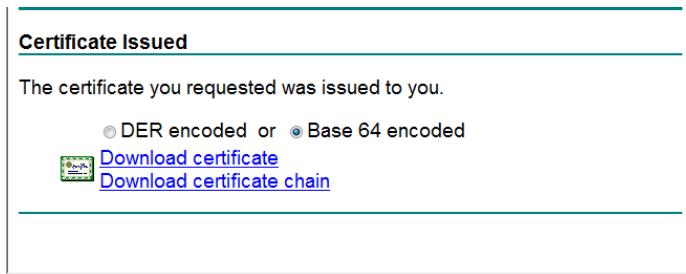

Certificate Template:
Web Server

Additional Attributes:
Attributes:

9. Open the *certreq.txt* file that you created and saved in Step 4, and then copy its contents to the 'Saved Request' field.
10. From the 'Certificate Template' drop-down list, select **Web Server**.

- 11.** Click **Submit**.

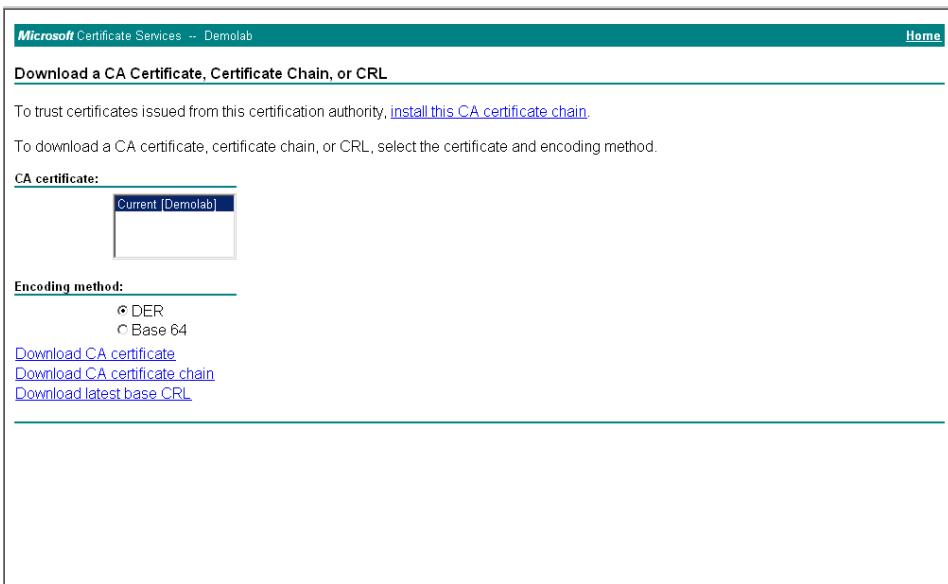

Figure 4-27: Certificate Issued Page

The screenshot shows a web page titled "Certificate Issued". It displays a message stating "The certificate you requested was issued to you." Below this, there is a radio button group for "Encoding method" with options "DER encoded" and "Base 64 encoded", where "Base 64 encoded" is selected. There are two download links: "Download certificate" (with a file icon) and "Download certificate chain".

- 12.** Select the **Base 64 encoded** option for encoding, and then click **Download certificate**.
- 13.** Save the file as *gateway.cer* to a folder on your computer.
- 14.** Click the **Home** button or navigate to the certificate server at <http://<Certificate Server>/CertSrv>.
- 15.** Click **Download a CA certificate, certificate chain, or CRL**.

Figure 4-28: Download a CA Certificate, Certificate Chain, or CRL Page

The screenshot shows a web page titled "Download a CA Certificate, Certificate Chain, or CRL". It includes a note about trusting certificates from this certification authority and a link to "install this CA certificate chain". A section for "CA certificate" lists "Current [Demolab]" with a small thumbnail image. An "Encoding method" section shows "DER" selected over "Base 64". Below are three download links: "Download CA certificate", "Download CA certificate chain", and "Download latest base CRL".

- 16.** Under the 'Encoding method' group, select the **Base 64** option for encoding.
- 17.** Click **Download CA certificate**.
- 18.** Save the file as *certroot.cer* to a folder on your computer.

- 19.** In the E-SBC's Web interface, return to the Certificates page and do the following:
- In the 'Device Certificate' field, click **Browse** and select the *gateway.cer* certificate file that you saved on your computer in Step 13, and then click **Send File** to upload the certificate to the E-SBC.
 - In the 'Trusted Root Certificate Store' field, click **Browse** and select the *certroot.cer* certificate file that you saved on your computer in Step 18, and then click **Send File** to upload the certificate to the E-SBC.

Figure 4-29: Certificates Page (Uploading Certificate)

The screenshot shows the 'Certificates' configuration page. It has three main sections:

- Private key pass-phrase (optional):** A text input field containing 'audc' and two buttons: 'Browse...' and 'Send File'.
- Device Certificate:** A note stating 'Send Private Key file from your computer to the device. The file must be in either PEM or PFX (PKCS#12) format.' followed by 'Browse...' and 'Send File' buttons.
- Trusted Root Certificate Store:** A note stating 'Send "Trusted Root Certificate Store" file from your computer to the device. The file must be in textual PEM format.' followed by 'Browse...' and 'Send File' buttons.

A note at the bottom of the page reads: 'Note: Replacing the private key is not recommended but if it's done, it should be over a physically-secure network link.'

- 20.** Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.15 on page 87).

4.9 Step 9: Configure SRTP

This step describes how to configure media security. If you configure the Microsoft Mediation Server to use SRTP, you need to configure the E-SBC to operate in the same manner. Note that SRTP was enabled for Lync Server 2013 when you configured an IP Profile for Lync Server 2013 (see Section 4.6 on page 50).

➤ **To configure media security:**

1. Open the Media Security page (**Configuration** tab > **Media** menu > **Media Security**).
2. Configure the parameters as follows:

Parameter	Value
Media Security	Enable

Figure 4-30: Configuring SRTP

General Media Security Settings		
Media Security	Enable	▼
Aria Protocol Support	Disable	▼
Media Security Behavior	Mandatory	▼
Authentication On Transmitted RTP Packets	Active	▼
Encryption On Transmitted RTP Packets	Active	▼
Encryption On Transmitted RTCP Packets	Active	▼
SRTP Tunneling Authentication for RTP	Disable	▼
SRTP Tunneling Authentication for RTCP	Disable	▼

3. Click **Submit**.
4. Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.15 on page 87).

4.10 Step 10: Configure IP-to-IP Call Routing Rules

This step describes how to configure IP-to-IP call routing rules. These rules define the routes for forwarding SIP messages (e.g., INVITE) received from one IP entity to another. The E-SBC selects the rule whose configured input characteristics (e.g., IP Group) match those of the incoming SIP message. If the input characteristics do not match the first rule in the table, they are compared to the second rule, and so on, until a matching rule is located. If no rule is matched, the message is rejected. The routing rules use the configured IP Groups to denote the source and destination of the call. As configured in Section 4.5 on page 48, IP Group 1 represents Lync Server 2013, IP Group 2 represents Virgin Media SIP Trunk A and IP Group 3 represents Virgin Media SIP Trunk B.

For the interoperability test topology, the following IP-to-IP routing rules need to be configured to route calls between Lync Server 2013 (LAN) and Virgin Media SIP Trunk (WAN):

- Terminate SIP OPTIONS messages on the E-SBC that are received from the LAN
- Reroute SIP OPTIONS messages, received from Virgin Media SIP Trunk A back to SIP Trunk A
- Reroute SIP OPTIONS messages, received from Virgin Media SIP Trunk B back to SIP Trunk B
- Calls from Lync Server 2013 to Virgin Media SIP Trunk A
- Calls from Virgin Media SIP Trunk A to Lync Server 2013
- Calls from Lync Server 2013 to Virgin Media SIP Trunk B
- Calls from Virgin Media SIP Trunk B to Lync Server 2013

➤ **To configure IP-to-IP routing rules:**

1. Open the IP-to-IP Routing Table page (**Configuration** tab > **VoIP** menu > **SBC** > **Routing SBC** > **IP-to-IP Routing Table**).
2. Configure a rule to terminate SIP OPTIONS messages received from the LAN:
3. Click **Add**.
4. Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	0
Route Name	Lync Options term (arbitrary descriptive name)
Source IP Group ID	1
Request Type	OPTIONS

Figure 4-31: Configuring IP-to-IP Routing Rule for Terminating SIP OPTIONS from LAN – Rule Tab

Rule	Action
→ Index	0

Call Setup Rules Set ID	-1

Submit **Cancel**

9. Click the **Action** tab, and then configure the parameters as follows:

Parameter	Value
Destination Type	IP Group
Destination IP Group ID	2
Destination SRD ID	2

Figure 4-34: Configuring IP-to-IP Routing Rule for Terminating SIP OPTIONS from Virgin Media Trunk A – Action Tab

The screenshot shows a configuration interface for a SIP routing rule. At the top, there are two tabs: "Rule" (which is selected) and "Action". Below the tabs, there is a table with various configuration parameters and their values. The parameters and their values are as follows:

Index	1
→ Destination Type	IP Group
→ Destination IP Group ID	2
→ Destination SRD ID	2
Destination Address	
Destination Port	0
Destination Transport Type	
Alternative Route Options	Route Row
Group Policy	None
Cost Group	None

At the bottom right of the interface are two buttons: "Submit" and "Cancel".

10. Configure a rule to reroute SIP OPTIONS messages, received from Virgin Media SIP Trunk B back to SIP Trunk A:
11. Click **Add**.
12. Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	2
Route Name	Trunk B Options term (arbitrary descriptive name)
Source IP Group ID	3
Request Type	OPTIONS

Figure 4-35: Configuring IP-to-IP Routing Rule for Terminating SIP OPTIONS from Virgin Media Trunk B – Rule Tab

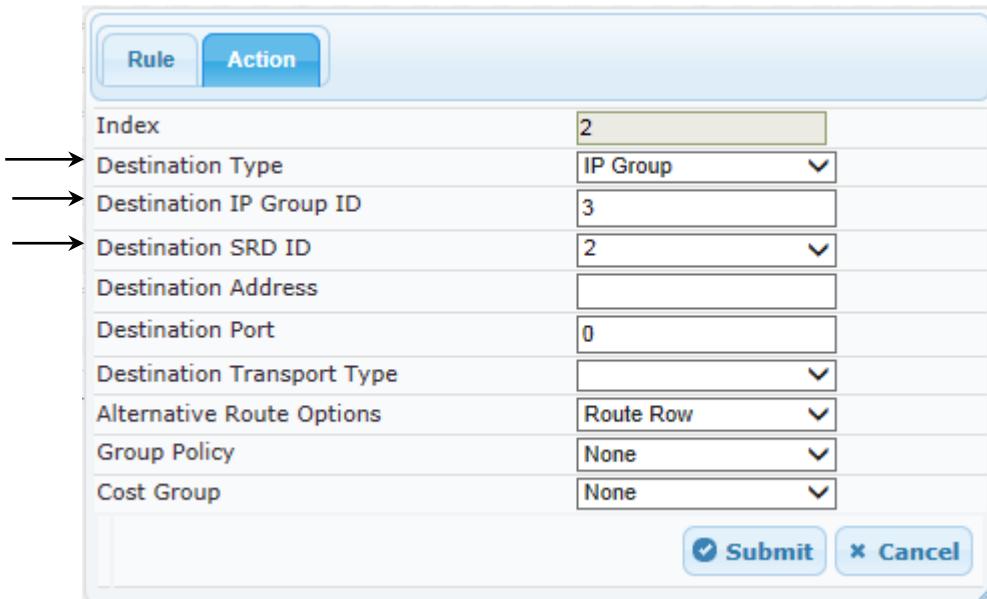

Rule	Action
Index	2
Route Name	Trunk B Options term

Group Policy	None
Cost Group	None

Submit
 Cancel

- 22.** Configure a rule to route calls from Lync Server 2013 to Virgin Media SIP Trunk B:

- 23.** Click **Add**.

24. Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	5
Route Name	Lync to Trunk B (arbitrary descriptive name)
Source IP Group ID	1

Figure 4-41: Configuring IP-to-IP Routing Rule for Lync to Virgin Media Trunk B – Rule tab

The screenshot shows a configuration interface for a routing rule. At the top, there are two tabs: 'Rule' (which is selected) and 'Action'. Below the tabs, there is a list of parameters with their current values:

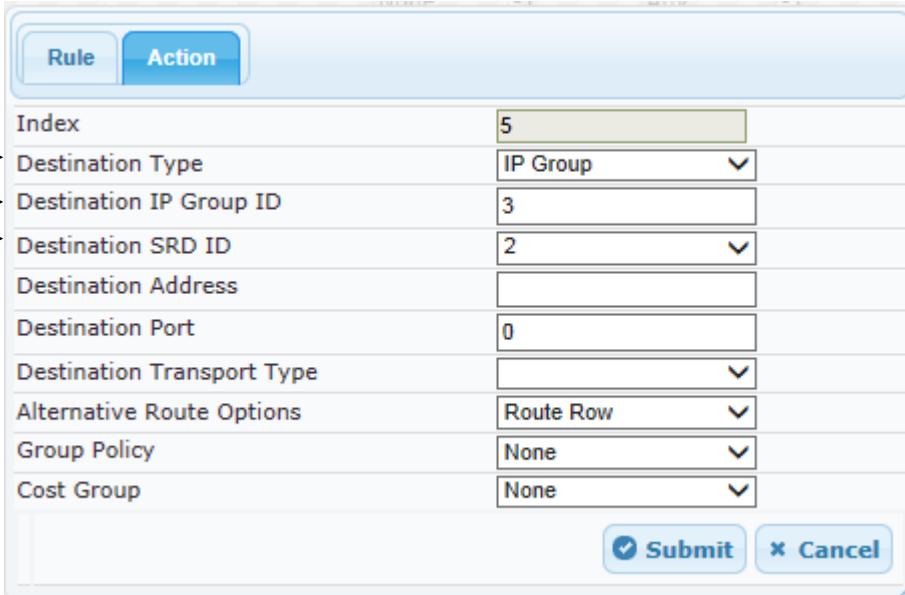

Index	5
Route Name	Lync to Trunk B
Source IP Group ID	1
Source Username Prefix	*
Source Host	*
Destination Username Prefix	*
Destination Host	*
Request Type	All
Message Condition	None
ReRoute IP Group ID	-1
Call Trigger	Any
Call Setup Rules Set ID	-1

At the bottom right of the form are two buttons: 'Submit' and 'Cancel'.

- 25.** Click the **Action** tab, and then configure the parameters as follows:

Parameter	Value
Destination Type	IP Group
Destination IP Group ID	3
Destination SRD ID	2

Figure 4-42: Configuring IP-to-IP Routing Rule for Lync to Virgin Media Trunk B – Action tab

Parameter	Value
Index	5
Destination Type	IP Group
Destination IP Group ID	3
Destination SRD ID	2
Destination Address	
Destination Port	0
Destination Transport Type	
Alternative Route Options	Route Row
Group Policy	None
Cost Group	None

- 26.** Configure a rule to route calls from Virgin Media SIP Trunk B to Lync Server 2013:
27. Click **Add**.

28. Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	6
Route Name	Trunk B to Lync (arbitrary descriptive name)
Source IP Group ID	3

Figure 4-43: Configuring IP-to-IP Routing Rule for Virgin Media Trunk B to Lync – Rule tab

The screenshot shows a configuration interface for a routing rule. At the top, there are two tabs: 'Rule' (which is selected) and 'Action'. Below the tabs is a table with several rows, each containing a parameter name and its corresponding value or selection. The parameters and their values are as follows:

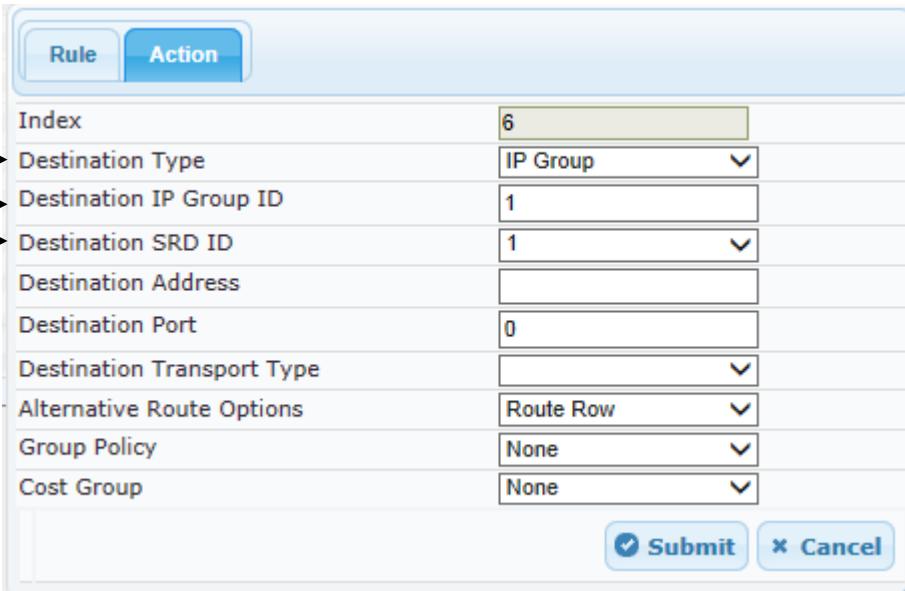

Index	6
Route Name	Trunk B to Lync
Source IP Group ID	3
Source Username Prefix	*
Source Host	*
Destination Username Prefix	*
Destination Host	*
Request Type	All
Message Condition	None
ReRoute IP Group ID	-1
Call Trigger	Any
Call Setup Rules Set ID	-1

At the bottom right of the form are two buttons: 'Submit' and 'Cancel'.

- 29.** Click the **Action** tab, and then configure the parameters as follows:

Parameter	Value
Destination Type	IP Group
Destination IP Group ID	1
Destination SRD ID	1

Figure 4-44: Configuring IP-to-IP Routing Rule for Virgin Media Trunk B to Lync – Action tab

The figure shows a configuration dialog for an IP-to-IP routing rule. The 'Action' tab is selected. The 'Index' field is set to 6. The 'Destination Type' field is set to 'IP Group'. The 'Destination IP Group ID' and 'Destination SRD ID' fields are both set to 1. Other fields like 'Destination Address', 'Destination Port', 'Destination Transport Type', 'Alternative Route Options', 'Group Policy', and 'Cost Group' are also visible. At the bottom are 'Submit' and 'Cancel' buttons.

The configured routing rules are shown in the figure below:

Figure 4-45: Configured IP-to-IP Routing Rules in IP-to-IP Routing Table

IP-to-IP Routing Table										
Actions		IP-to-IP Routing Table								
Index	Route Name	Source Host	Destination Username Prefix	Destination Host	Message Condition	ReRoute IP Group ID	Call Trigger	Call Setup Rules Set ID	Destination Type	Destination SRD ID
0	Lync Options ter*	*	*		None	-1	Any	-1	Dest Address	None
1	Trunk A Options*	*	*		None	-1	Any	-1	IP Group	2
2	Trunk B Options*	*	*		None	-1	Any	-1	IP Group	2
3	Lync to Trunk A*	*	*		None	-1	Any	-1	IP Group	2
4	Trunk A to Lync*	*	*		None	-1	Any	-1	IP Group	1
5	Lync to Trunk B*	*	*		None	-1	Any	-1	IP Group	2
6	Trunk B to Lync*	*	*		None	-1	Any	-1	IP Group	1

Note: The routing configuration may change according to your specific deployment topology.

4.11 Step 11: Configure IP-to-IP Manipulation Rules

This step describes how to configure IP-to-IP manipulation rules. These rules manipulate the source and / or destination number. The manipulation rules use the configured IP Groups to denote the source and destination of the call. As configured in Section 4.5 on page 48, IP Group 1 represents Lync Server 2013, IP Group 2 represents Virgin Media SIP Trunk A and IP Group 3 represents Virgin Media SIP Trunk B.

Note: Adapt the manipulation table according to your environment dial plan.

For this interoperability test topology, a manipulation is configured to add the "+" (plus sign) to the destination number for calls from IP Group 2 (Virgin Media SIP Trunk A) or IP Group 3 (Virgin Media SIP Trunk B) to IP Group 1 (i.e., Lync Server 2013) for any destination username prefix.

➤ **To configure a number manipulation rule:**

1. Open the IP-to-IP Outbound Manipulation page (**Configuration** tab > **VoIP** menu > **SBC** > **Manipulations SBC** > **IP-to-IP Outbound**).
2. Click **Add**.
3. Click the **Rule** tab, and then configure the parameters as follows:

Parameter	Value
Index	1
Source IP Group	2
Destination IP Group	1
Destination Username Prefix	* (asterisk sign)

Figure 4-46: Configuring IP-to-IP Outbound Manipulation Rule – Rule Tab

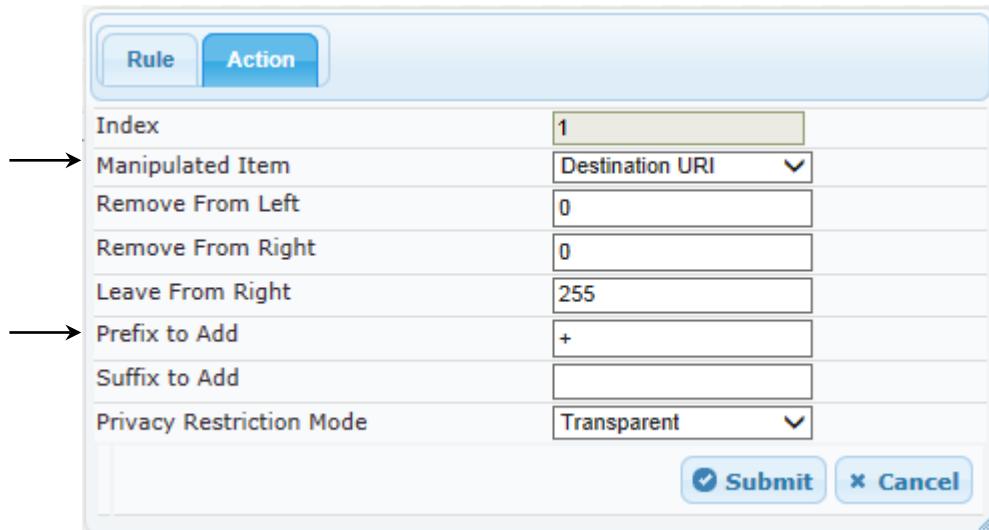

Parameter	Value
Index	1
Manipulation Name	
Additional Manipulation	No
Source IP Group ID	2
Destination IP Group ID	1
Source Username Prefix	*
Source Host	*
Destination Username Prefix	*
Destination Host	*
Calling Name Prefix	*
Message Condition	None
Request Type	All
ReRoute IP Group ID	-1
Call Trigger	Any

Submit Cancel

4. Click the **Action** tab, and then configure the parameters as follows:

Parameter	Value
Manipulated Item	Destination URI
Prefix to Add	+ (plus sign)

Figure 4-47: Configuring IP-to-IP Outbound Manipulation Rule - Action Tab

5. Click **Submit**.

Figure 4-48: Example of Configured IP-to-IP Outbound Manipulation Rules

IP to IP Outbound Manipulation															
		Add +	Insert +												
Index	Manipulation Name	Additional Manipulation	Source IP Group ID	Destination IP Group ID	Source Username Prefix	Source Host	Destination Username Prefix	Destination Host	Request Type	Manipulated Item	Prefix to Add	Suffix to Add			
1		No	2	1	*	*	*	*	All	Destination URI	+				
2		No	1	2	+	*	*	*	All	Source URI					
3		No	3	1	*	*	*	*	All	Destination URI	+				
4		No	1	3	+	*	*	*	All	Source URI					

Page 1 of 1 Show 10 records per page View 1 - 4 of 4

Rule Index	Description
1	Calls from IP Group 2 to IP Group 1 with any destination number (*), add "+" to the prefix of the destination number.
2	Calls from IP Group 1 to IP Group 2 with source number prefix "+", remove the "+" from this prefix.
3	Calls from IP Group 3 to IP Group 1 with any destination number (*), add "+" to the prefix of the destination number.
4	Calls from IP Group 1 to IP Group 3 with source number prefix "+", remove the "+" from this prefix.

4.12 Step 12: Configure Message Manipulation Rules

This step describes how to configure SIP message manipulation rules. SIP message manipulation rules can include insertion, removal, and/or modification of SIP headers. Manipulation rules are grouped into Manipulation Sets, enabling you to apply multiple rules to the same SIP message (IP entity).

Once you have configured the SIP message manipulation rules, you need to assign them to the relevant IP Group (in the IP Group table) and determine whether they must be applied to inbound or outbound messages.

➤ **To configure SIP message manipulation rule:**

1. Open the Message Manipulations page (**Configuration** tab > **VoIP** menu > **SIP Definitions** > **Msg Policy & Manipulation** > **Message Manipulations**).
2. Configure a new manipulation rule (Manipulation Set 4) for Virgin Media SIP Trunk A. This rule is applied to response messages sent to the Virgin Media SIP Trunk A (IP Group 2) or Trunk B (IP Group 3) and consist method type '410 Gone'. This replaces the method type '410' with the value '480', according to Virgin Media request.

Parameter	Value
Index	0
Manipulation Set ID	4
Message Type	any.response
Condition	header.request-uri.methodtype=='410'
Action Subject	header.request-uri.methodtype
Action Type	Modify
Action Value	'480'
Row Role	Use Current Condition

Figure 4-49: Configuring SIP Message Manipulation Rule 1 (for Virgin Media SIP Trunk A)

The screenshot shows a configuration dialog titled 'Edit Record #0'. It contains fields for various parameters of a manipulation rule:

- Index: 0
- Manipulation Name: (empty)
- Manipulation Set ID: 4
- Message Type: any.response
- Condition: header.request-uri.methodtype=='410'
- Action Subject: header.request-uri.methodtype
- Action Type: Modify
- Action Value: '480'
- Row Role: Use Current Condition

At the bottom right are 'Submit' and 'Cancel' buttons.

Figure 4-50: Example of Configured SIP Message Manipulation Rule

Message Manipulations							
Add +	Insert +						
Index	Manipulation Name	Manipulation Set ID	Message Type	Condition	Action Subject	Action Type	Action Value
0		4	any.response	header.request-uri.method == header.request-uri.method	Modify		'480'

Page 1 of 1 Show 10 records per page View 1 - 1 of 1

The table displayed below includes SIP message manipulation rule which is bound together by commonality via the Manipulation Set ID 4 which is executed for messages sent to and from the Virgin Media SIP Trunks (IP Groups 2 and 3). This rule is specifically required to enable proper interworking between Virgin Media SIP Trunk and Lync Server 2013. Refer to the *User's Manual* for further details concerning the full capabilities of header manipulation.

Rule Index	Rule Description	Reason for Introducing Rule
0	This rule is applied to response messages sent to the Virgin Media SIP Trunk A (IP Group 2) or Trunk B (IP Group 3) and consist method type '410 Gone'. This replaces the method type '410' with the value '480'.	Virgin Media request to change '410' method type to '480'.

3. Assign Manipulation Set ID 4 to IP Group 2:
 - a. Open the IP Group Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **IP Group Table**).
 - b. Select the row of IP Group 2, and then click **Edit**.
 - c. Click the **SBC** tab.
 - d. Set the 'Outbound Message Manipulation Set' field to 4.

Figure 4-51: Assigning Manipulation Set to IP Group 2

Common	GW	SBC
Index	2	
Classify By Proxy Set	Enable	
Max. Number of Registered Users	-1	
Inbound Message Manipulation Set	-1	
Outbound Message Manipulation Set	4	
Registration Mode	User Initiates Registration	
Authentication Mode	User Authenticates	
Authentication Method List		
SBC Client Forking Mode	Sequential	
Source URI Input	Not Configured	
Destination URI Input	Not Configured	
Username		
Password		
<input checked="" type="button"/> Submit <input type="button"/> Cancel		

- e. Click **Submit**.

4. Assign Manipulation Set ID 4 to IP Group 3:
 - a. Open the IP Group Table page (**Configuration** tab > **VoIP** menu > **VoIP Network** > **IP Group Table**).
 - b. Select the row of IP Group 3, and then click **Edit**.
 - c. Click the **SBC** tab.
 - d. Set the 'Outbound Message Manipulation Set' field to 4.

Figure 4-52: Assigning Manipulation Set 4 to IP Group 3

The screenshot shows a configuration interface for an IP Group. At the top, there are three tabs: Common, GW, and SBC. The SBC tab is currently selected. Below the tabs, there are several configuration fields:

Index	3
Classify By Proxy Set	Enable
Max. Number of Registered Users	-1
Inbound Message Manipulation Set	-1
Outbound Message Manipulation Set	4
Registration Mode	User Initiates Registration
Authentication Mode	User Authenticates
Authentication Method List	(empty)
SBC Client Forking Mode	Sequential
Source URI Input	Not Configured
Destination URI Input	Not Configured
Username	(empty)
Password	(empty)

At the bottom right of the form are two buttons: **Submit** (with a checkmark icon) and **Cancel**.

- e. Click **Submit**.

4.13 Step 13: Configure Registration Accounts

This step describes how to configure SIP registration accounts. This is required so that the E-SBC can register with the Virgin Media SIP Trunk on behalf of Lync Server 2013. The Virgin Media SIP Trunk doesn't require registration but does require authentication to provide service.

In the interoperability test topology, the Served IP Group is Lync Server 2013 (IP Group 1) and the Serving IP Groups are Virgin Media SIP Trunk A (IP Group 2) and Virgin Media SIP Trunk B (IP Group 3).

➤ **To configure a registration accounts:**

1. Open the Account Table page (**Configuration** tab > **VoIP** menu > **SIP Definitions** > **Account Table**).
2. Enter an index number ("0" for Virgin Media Trunk A), and then click **Add**.
3. Configure the account according to the provided information from Virgin Media, for example:

Parameter	Value
Served IP Group	1 (Lync Server 2013)
Serving IP Group	2 (Virgin Media SIP Trunk A)
Username	As provided by Virgin Media
Password	As provided by Virgin Media
Register	No
Application Type	SBC

4. Click **Apply**.
5. Repeat for Virgin Media Trunk B:

Parameter	Value
Served IP Group	1 (Lync Server 2013)
Serving IP Group	3 (Virgin Media SIP Trunk B)
Username	As provided by Virgin Media
Password	As provided by Virgin Media
Register	No
Application Type	SBC

6. Click **Apply**; the following screen appears:

Figure 4-53: Configuring SIP Registration Accounts

The screenshot shows a table titled 'Account Table' with columns: Index, Served Trunk Group, Served IP Group, Serving IP Group, User Name, Password, Host Name, Register, Contact User, and Application Type. There are two rows of data:

Index	Served Trunk Group	Served IP Group	Serving IP Group	User Name	Password	Host Name	Register	Contact User	Application Type
0	-1	1	2	virginpbx01_*			No		SBC
1	-1	1	3	virginpbx01_*			No		SBC

At the bottom, there are navigation buttons: Page 1 of 1, Show 10 records per page, and View 1 - 2 of 2.

7. Confirm that the 'Cnonce' field contains the default value of **Default_Cnonce**, by opening the Proxy & Registration page (**Configuration** tab > **VoIP** menu > **SIP Definitions** > **Proxy & Registration**).

Figure 4-54: Proxy & Registration

The screenshot shows the 'Proxy & Registration' configuration page with various settings listed in a table. An arrow points to the 'Cnonce' field at the bottom right.

Use Default Proxy	No
Proxy Name	
Redundancy Mode	Parking
Proxy IP List Refresh Time	60
Enable Fallback to Routing Table	Disable
Prefer Routing Table	No
Always Use Proxy	Disable
Redundant Routing Mode	Routing Table
SIP ReRouting Mode	Standard Mode
Gateway Name	
Gateway Registration Name	
DNS Query Type	A-Record
Proxy DNS Query Type	A-Record
Subscription Mode	Per Endpoint
Number of RTX Before Hot-Swap	3
Use Gateway Name for OPTIONS	No
User Name	
Password	Default_Passwd
Cnonce	Default_Cnonce

4.14 Step 14: Miscellaneous Configuration

This section describes miscellaneous E-SBC configuration.

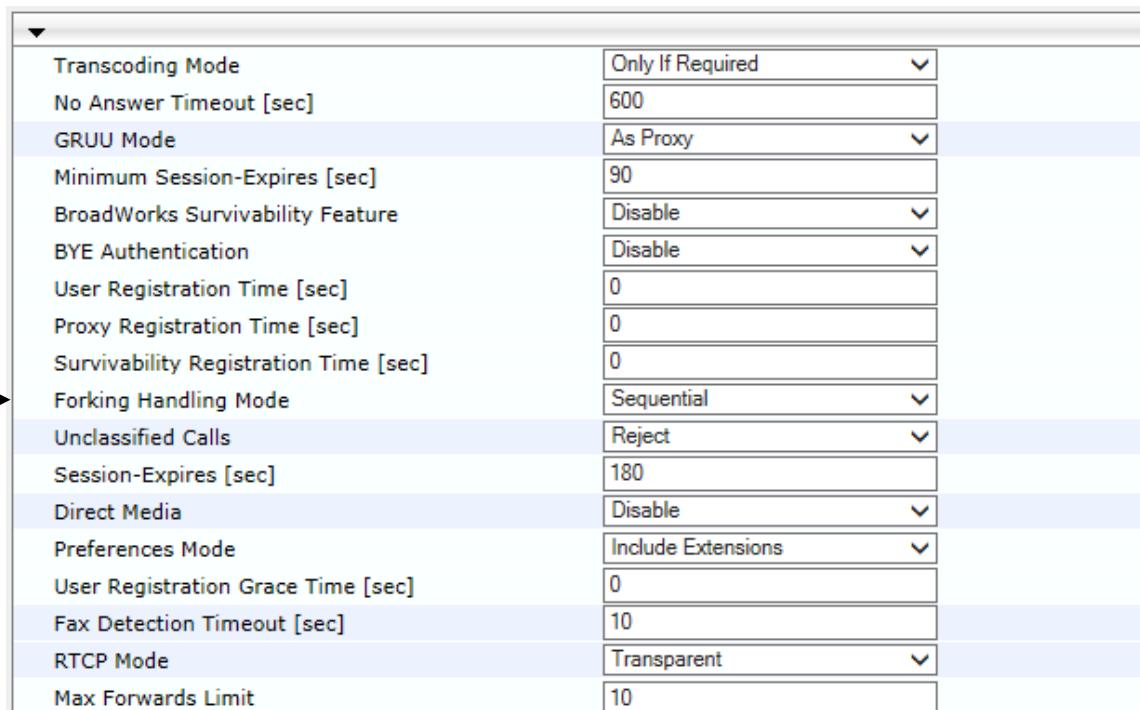

4.14.1 Step 14a: Configure Call Forking Mode

This step describes how to configure the E-SBC's handling of SIP 18x responses received for call forking of INVITE messages. For the interoperability test topology, if a SIP 18x response with SDP is received, the E-SBC opens a voice stream according to the received SDP. The E-SBC re-opens the stream according to subsequently received 18x responses with SDP or plays a ringback tone if 180 response without SDP is received. It's mandatory to set this field for the Lync Server 2013 environment.

➤ **To configure call forking:**

1. Open the General Settings page (**Configuration** tab > **VoIP** menu > **SBC** > **General Settings**).
2. From the 'SBC Forking Handling Mode' drop-down list, select **Sequential**.

Figure 4-55: Configuring Forking Mode

Transcoding Mode	Only If Required
No Answer Timeout [sec]	600
GRUU Mode	As Proxy
Minimum Session-Expires [sec]	90
BroadWorks Survivability Feature	Disable
BYE Authentication	Disable
User Registration Time [sec]	0
Proxy Registration Time [sec]	0
Survivability Registration Time [sec]	0
Forking Handling Mode	Sequential
Unclassified Calls	Reject
Session-Expires [sec]	180
Direct Media	Disable
Preferences Mode	Include Extensions
User Registration Grace Time [sec]	0
Fax Detection Timeout [sec]	10
RTCP Mode	Transparent
Max Forwards Limit	10

3. Click **Submit**.

4.15 Step 15: Reset the E-SBC

After you have completed the configuration of the E-SBC described in this chapter, save ("burn") the configuration to the E-SBC's flash memory with a reset for the settings to take effect.

➤ **To save the configuration to flash memory:**

1. Open the Maintenance Actions page (**Maintenance** tab > **Maintenance** menu > **Maintenance Actions**).

Figure 4-56: Resetting the E-SBC

Reset Configuration	
Reset Board	Reset
Burn To FLASH	Yes
Graceful Option	No
LOCK / UNLOCK	
Lock	LOCK
Graceful Option	No
Gateway Operational State	UNLOCKED
Save Configuration	
Burn To FLASH	BURN

2. Ensure that the 'Burn to FLASH' field is set to **Yes** (default).
3. Click the **Reset** button.

This page is intentionally left blank.

A AudioCodes INI File

The *ini* configuration file of the E-SBC, corresponding to the Web-based configuration as described in Section 4 on page 33, is shown below:

Note: To load and save an ini file, use the Configuration File page (**Maintenance tab > Software Update** menu > **Configuration File**).
