Document Revision Record

LTTRT	Description
39351	Initial document for Microsoft Lync 2013 and Mediant Version 6.6.
12660	Update for Microsoft Skype for Business 2015 and Mediant Version 7.0.
12661	Update with new Swisscom SIP Trunk service named "Enterprise SIP" and Mediant Version 7.2.
12662	Updates were made in accordance with Swisscom's request.
12663	Updates were made in accordance with Swisscom's request.

Documentation Feedback

AudioCodes continually strives to produce high quality documentation. If you have any comments (suggestions or errors) regarding this document, please fill out the Documentation Feedback form on our Web site at <https://online.audiocodes.com/documentation-feedback>.

1 Introduction

This Configuration Note describes how to set up AudioCodes Enterprise Session Border Controller (hereafter, referred to as *E-SBC*) for interworking between Swisscom's SIP Trunk and Microsoft's Skype for Business Server 2015 environment.

You can also use AudioCodes' SBC Wizard tool to automatically configure the E-SBC based on this interoperability setup. However, it is recommended you read through this document to better understand the various configuration options. For more information on AudioCodes' SBC Wizard including the download option, visit the AudioCodes Web site at <https://www.audicodes.com/>.

1.1 Intended Audience

The document is intended for engineers, or AudioCodes and Swisscom Partners who are responsible for installing and configuring Swisscom's SIP Trunk and Microsoft's Skype for Business Server 2015 for enabling VoIP calls using AudioCodes E-SBC.

1.2 About AudioCodes E-SBC Product Series

AudioCodes' family of E-SBC devices enables reliable connectivity and security between the Enterprise's and the service provider's VoIP networks.

The E-SBC provides perimeter defense as a way of protecting Enterprises from malicious VoIP attacks; mediation for allowing the connection of any PBX and/or IP-PBX to any service provider; and Service Assurance for service quality and manageability.

Designed as a cost-effective appliance, the E-SBC is based on field-proven VoIP and network services with a native host processor, allowing the creation of purpose-built multiservice appliances, providing smooth connectivity to cloud services, with integrated quality of service, SLA monitoring, security and manageability. The native implementation of SBC provides a host of additional capabilities that are not possible with standalone SBC appliances such as VoIP mediation, PSTN access survivability, and third-party value-added services applications. This enables Enterprises to utilize the advantages of converged networks and eliminate the need for standalone appliances.

AudioCodes E-SBC is available as an integrated solution running on top of its field-proven Mediant Media Gateway and Multi-Service Business Router platforms, or as a software-only solution for deployment with third-party hardware.

This page is intentionally left blank.

2 Component Information

2.1 AudioCodes E-SBC Version

Table 2-1: AudioCodes E-SBC Version

SBC Vendor	AudioCodes
Models	<ul style="list-style-type: none"> ▪ Mediant 500 E-SBC ▪ Mediant 500L Gateway & E-SBC ▪ Mediant 800B Gateway & E-SBC ▪ Mediant 1000B Gateway & E-SBC ▪ Mediant 2600 E-SBC ▪ Mediant 4000 SBC ▪ Mediant 4000B SBC ▪ Mediant 9000 SBC ▪ Mediant Software SBC (SE and VE)
Software Version	SIP_7.20A.158.035
Protocol	<ul style="list-style-type: none"> ▪ SIP/TCP (to the Swisscom SIP Trunk) ▪ SIP/TCP or SIP/TLS (to the S4B FE Server)
Additional Notes	None

2.2 Swisscom SIP Trunking Version

Vendor/Service Provider	Swisscom
SSW Model/Service	
Software Version	
Protocol	SIP
Additional Notes	None

2.3 Microsoft Skype for Business Server 2015 Version

Table 2-3: Microsoft Skype for Business Server 2015 Version

Vendor	Microsoft
Model	Skype for Business
Software Version	Release 2015 6.0.9319.0
Protocol	SIP
Additional Notes	None

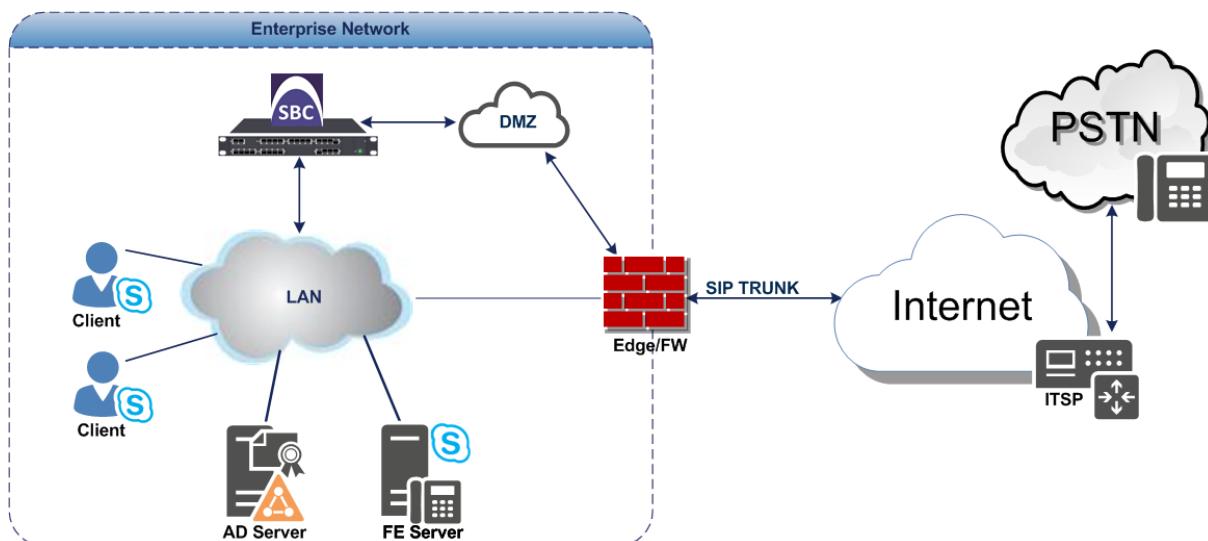

2.4 Interoperability Test Topology

The interoperability testing between AudioCodes E-SBC and Swisscom SIP Trunk with Skype for Business 2015 was done using the following topology setup:

- Enterprise deployed with Microsoft Skype for Business Server 2015 in its private network for enhanced communication within the Enterprise.
- Enterprise wishes to offer its employees enterprise-voice capabilities and to connect the Enterprise to the PSTN network using Swisscom's SIP Trunking service.
- AudioCodes E-SBC is implemented to interconnect between the Enterprise LAN and the SIP Trunk.
 - **Session:** Real-time voice session using the IP-based Session Initiation Protocol (SIP).
 - **Border:** IP-to-IP network border between Skype for Business Server 2015 network in the Enterprise LAN and Swisscom's SIP Trunk located in the public network.

The figure below illustrates this interoperability test topology:

Figure 2-1: Interoperability Test Topology between E-SBC and Microsoft Skype for Business with Swisscom SIP Trunk

2.4.1 Environment Setup

The interoperability test topology includes the following environment setup:

Table 2-4: Environment Setup

Area	Setup
Network	<ul style="list-style-type: none"> ▪ Microsoft Skype for Business Server 2015 environment is located on the Enterprise's LAN ▪ Swisscom SIP Trunk is located on the WAN
Signaling Transcoding	<ul style="list-style-type: none"> ▪ Microsoft Skype for Business Server 2015 operates with SIP-over-TLS transport type ▪ Swisscom SIP Trunk operates with SIP-over-TCP transport type
Codecs Transcoding	<ul style="list-style-type: none"> ▪ Microsoft Skype for Business Server 2015 supports G.711A-law and G.711U-law coders ▪ Swisscom SIP Trunk supports G.711A-law, G.729 and G.722 coders
Media Transcoding	<ul style="list-style-type: none"> ▪ Microsoft Skype for Business Server 2015 operates with SRTP media type ▪ Swisscom SIP Trunk operates with RTP media type

2.4.2 Known Limitations

Calls with special arrangements will be billed on the trunk main number instead of the user number (this is because the PAI header contains the same number as the SIP 'From' header). This limitation does not affect the completion of such calls.

This page is intentionally left blank.

3 Configuring Skype for Business Server 2015

This chapter describes how to configure Microsoft Skype for Business Server 2015 to operate with AudioCodes E-SBC.

Note: Dial plans, voice policies, and PSTN usages are also necessary for Enterprise voice deployment; however, they are beyond the scope of this document.

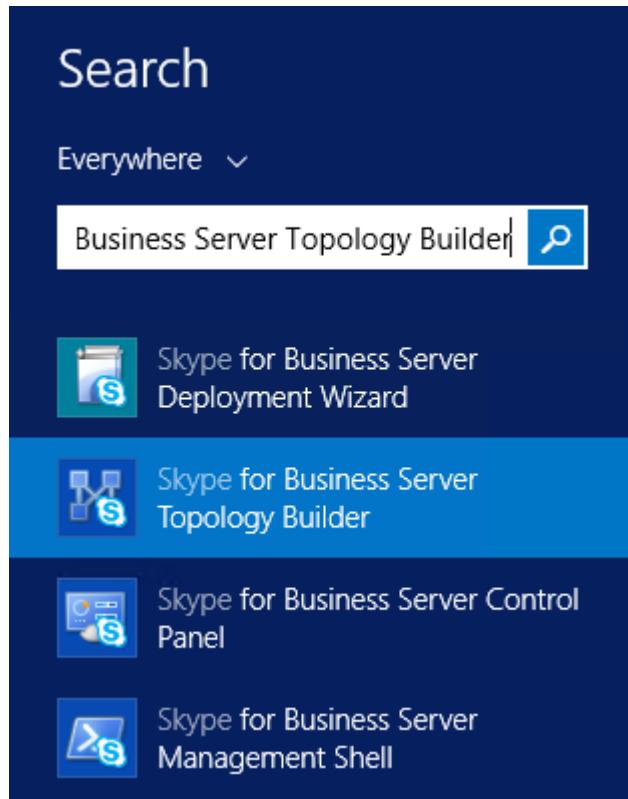

3.1 Configuring the E-SBC as an IP / PSTN Gateway

The procedure below describes how to configure the E-SBC as an IP / PSTN Gateway.

➤ **To configure E-SBC as IP/PSTN Gateway and associate it with Mediation Server:**

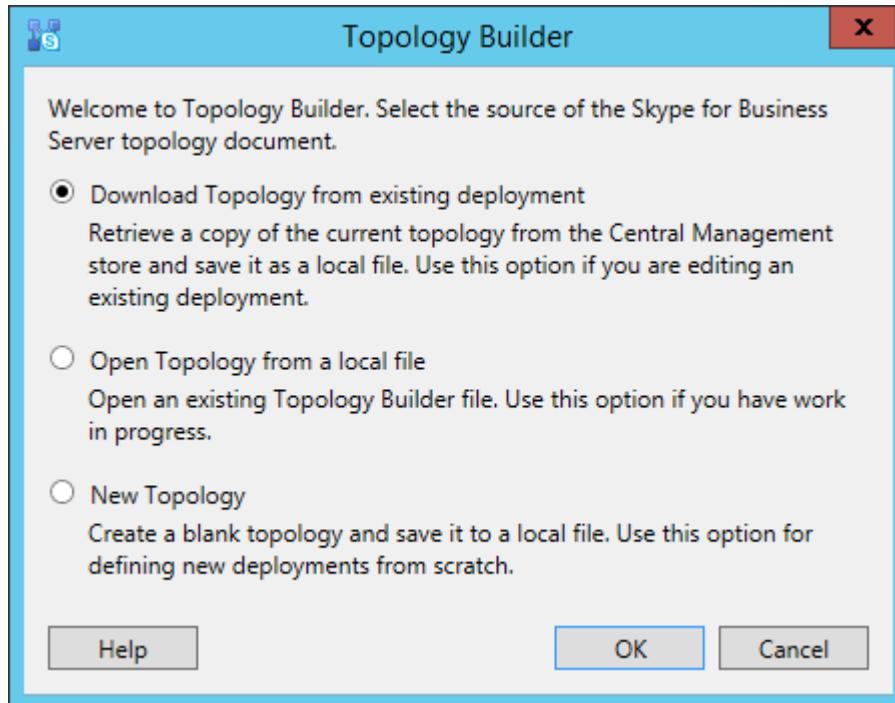

1. On the server where the Topology Builder is installed, start the Skype for Business Server 2015 Topology Builder (Windows Start menu > search for Skype for Business Server Topology Builder), as shown below:

Figure 3-1: Starting the Skype for Business Server Topology Builder

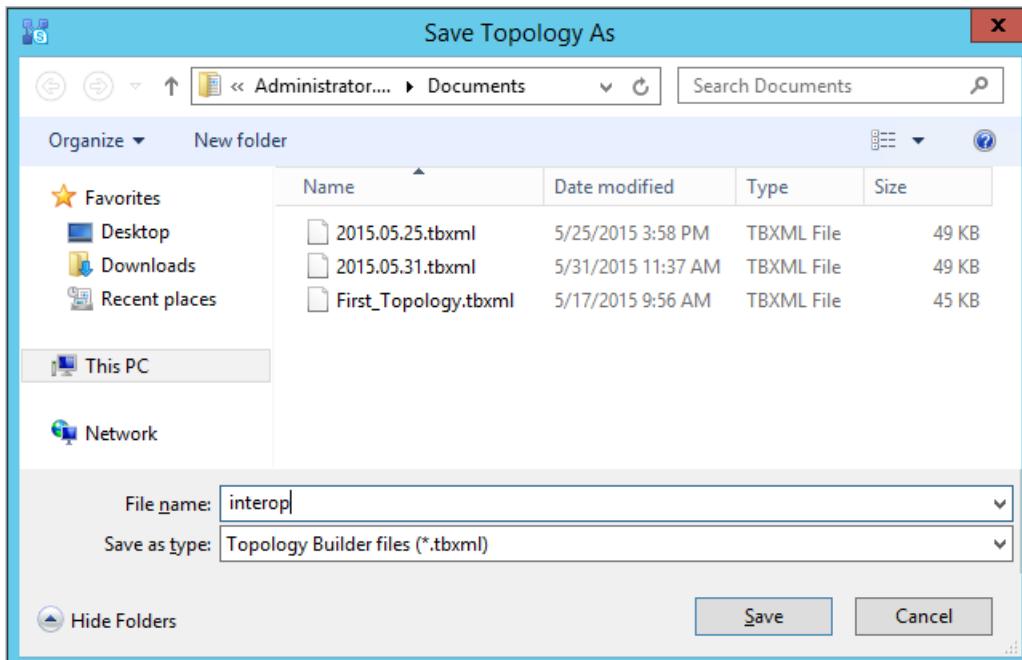

The following is displayed:

Figure 3-2: Topology Builder Dialog Box

2. Select the **Download Topology from existing deployment** option, and then click **OK**; you are prompted to save the downloaded Topology:

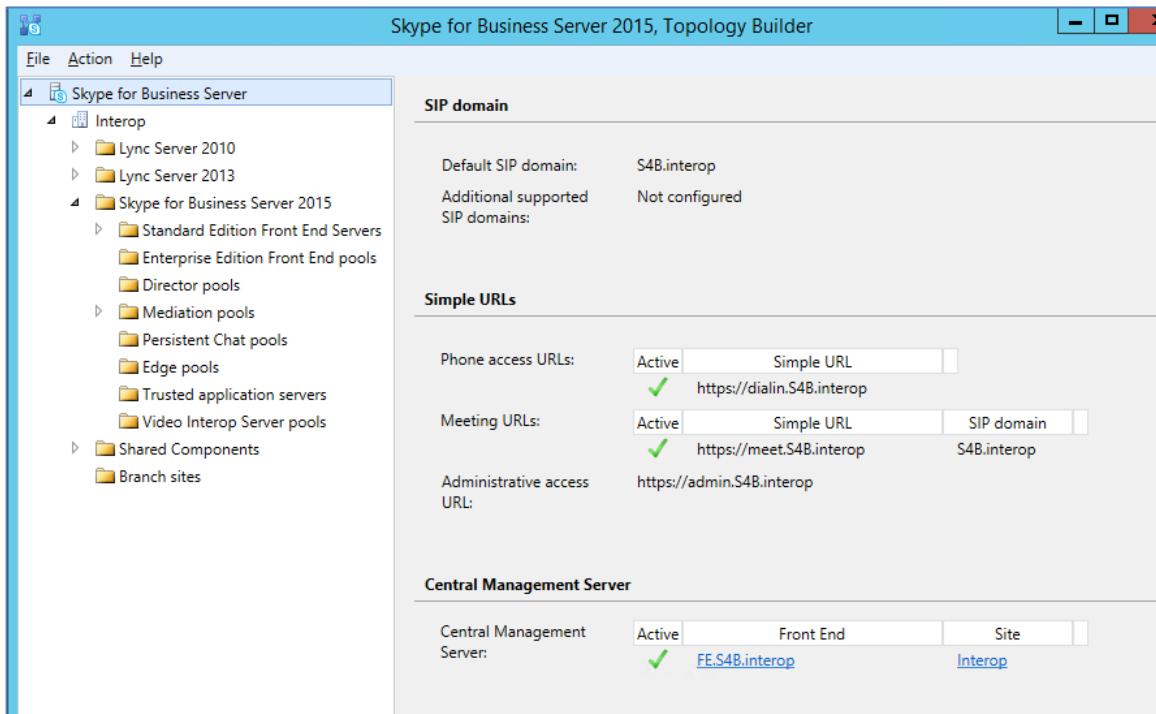

Figure 3-3: Save Topology Dialog Box

3. Enter a name for the Topology file, and then click **Save**. This step enables you to roll back from any changes you make during the installation.

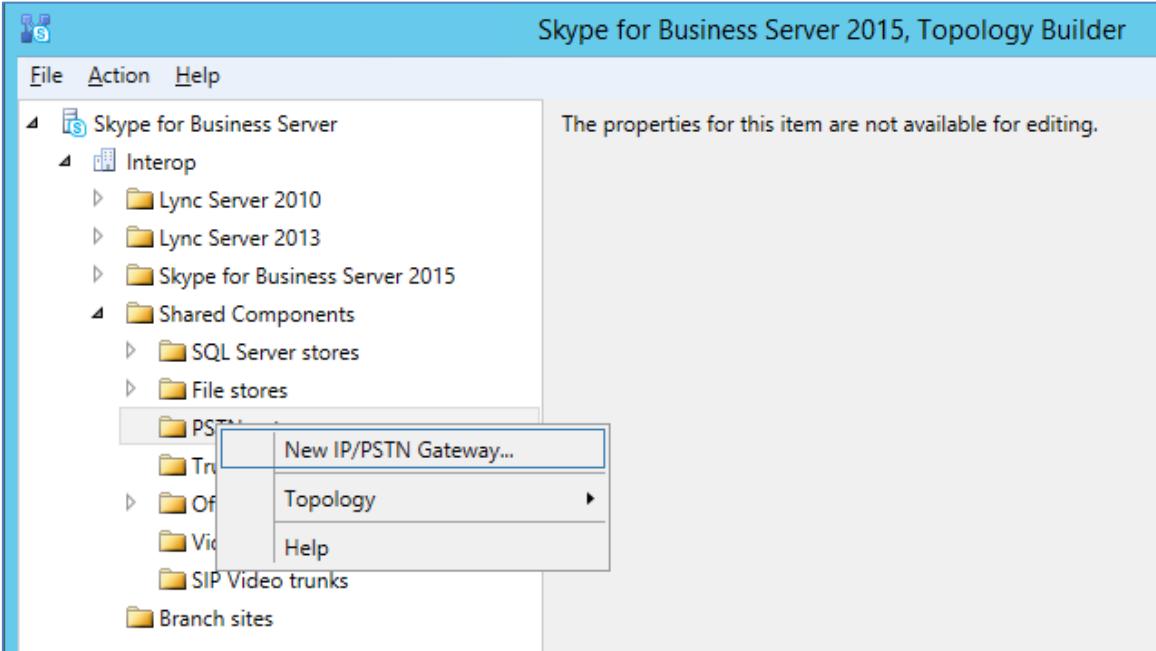

The Topology Builder screen with the downloaded Topology is displayed:

Figure 3-4: Downloaded Topology

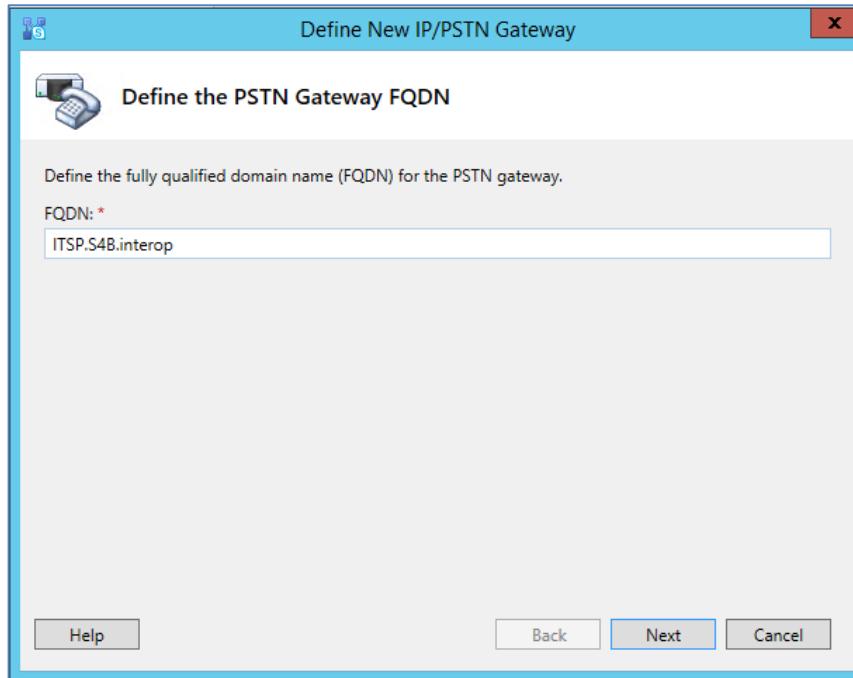

- Under the **Shared Components** node, right-click the **PSTN gateways** node, and then from the shortcut menu, choose **New IP/PSTN Gateway**, as shown below:

Figure 3-5: Choosing New IP/PSTN Gateway

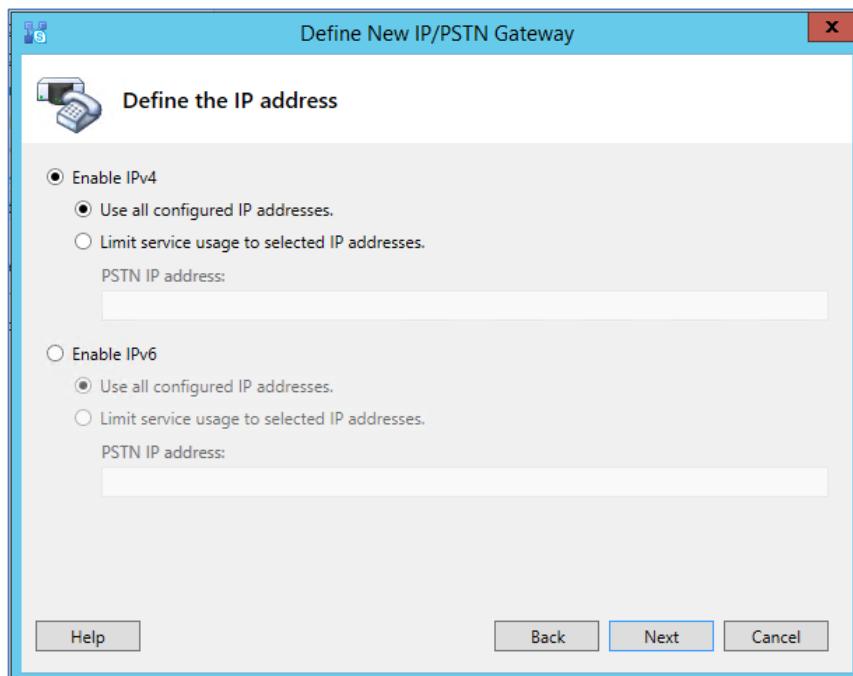

The following is displayed:

Figure 3-6: Define the PSTN Gateway FQDN

5. Enter the Fully Qualified Domain Name (FQDN) of the E-SBC (e.g., **ITSP.S4B.interop**). This FQDN should be equivalent to the configured Subject Name (CN) in the TLS Certificate Context (see Section 4.9.3 on page 58).
6. Click **Next**; the following is displayed:

Figure 3-7: Define the IP Address

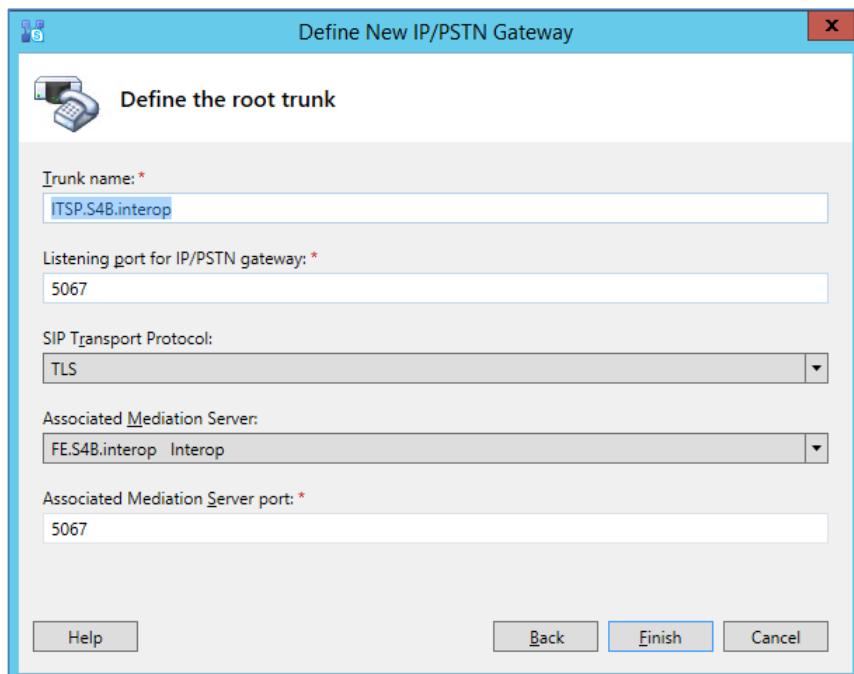

7. Define the listening mode (IPv4 or IPv6) of the IP address of your new PSTN gateway, and then click **Next**.

8. Define a *root trunk* for the PSTN gateway. A trunk is a logical connection between the Mediation Server and a gateway uniquely identified by the following combination: Mediation Server FQDN, Mediation Server listening port (TLS or TCP), gateway IP and FQDN, and gateway listening port.

**Notes:**

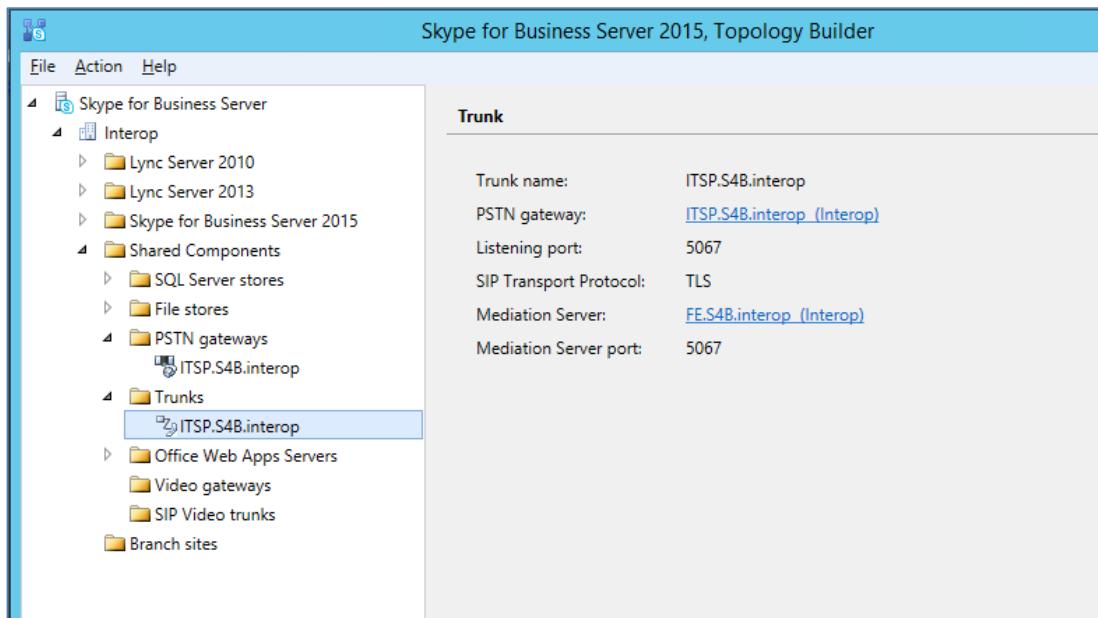

- When defining a PSTN gateway in Topology Builder, you must define a root trunk to successfully add the PSTN gateway to your topology.
- The root trunk cannot be removed until the associated PSTN gateway is removed.

Figure 3-8: Define the Root Trunk

- a. In the 'Listening Port for IP/PSTN Gateway' field, enter the listening port that the E-SBC will use for SIP messages from the Mediation Server that will be associated with the root trunk of the PSTN gateway (e.g., **5067**). This parameter is later configured in the SIP Interface table (see Section 4.3 on page 36).
- b. In the 'SIP Transport Protocol' field, select the transport type (e.g., **TLS**) that the trunk uses. This parameter is later configured in the SIP Interface table (see Section 4.3 on page 36).
- c. In the 'Associated Mediation Server' field, select the Mediation Server pool to associate with the root trunk of this PSTN gateway.
- d. In the 'Associated Mediation Server Port' field, enter the listening port that the Mediation Server will use for SIP messages from the SBC (e.g., **5067**).
- e. Click **Finish**.

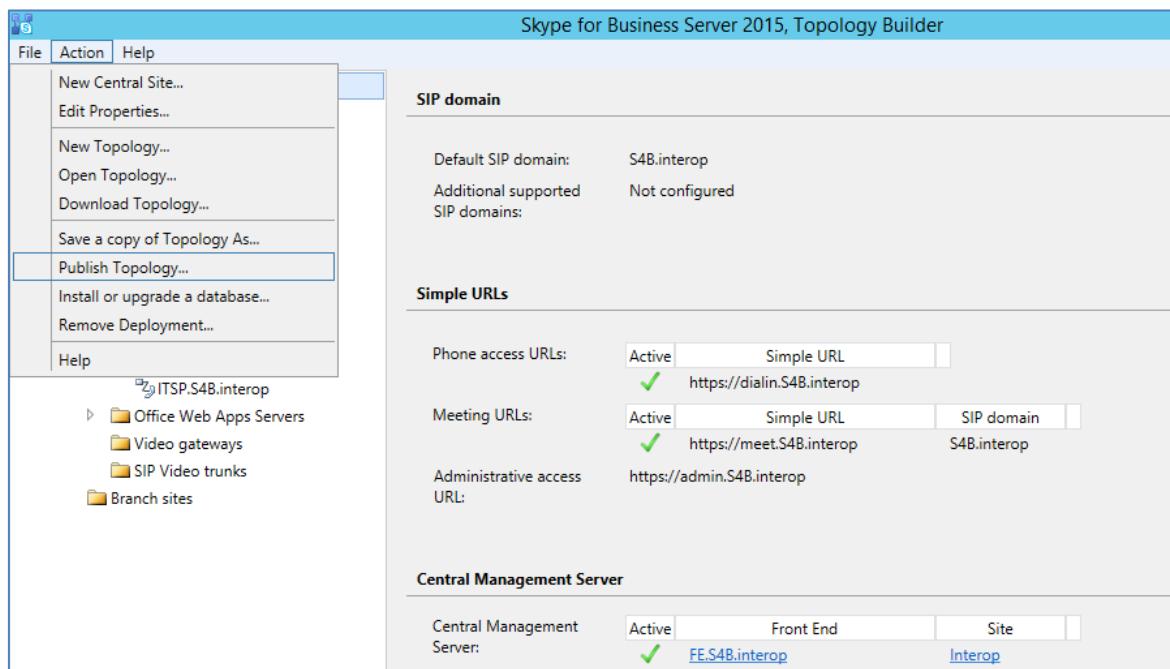

The E-SBC is added as a PSTN gateway, and a trunk is created as shown below:

Figure 3-9: E-SBC added as IP/PSTN Gateway and Trunk Created

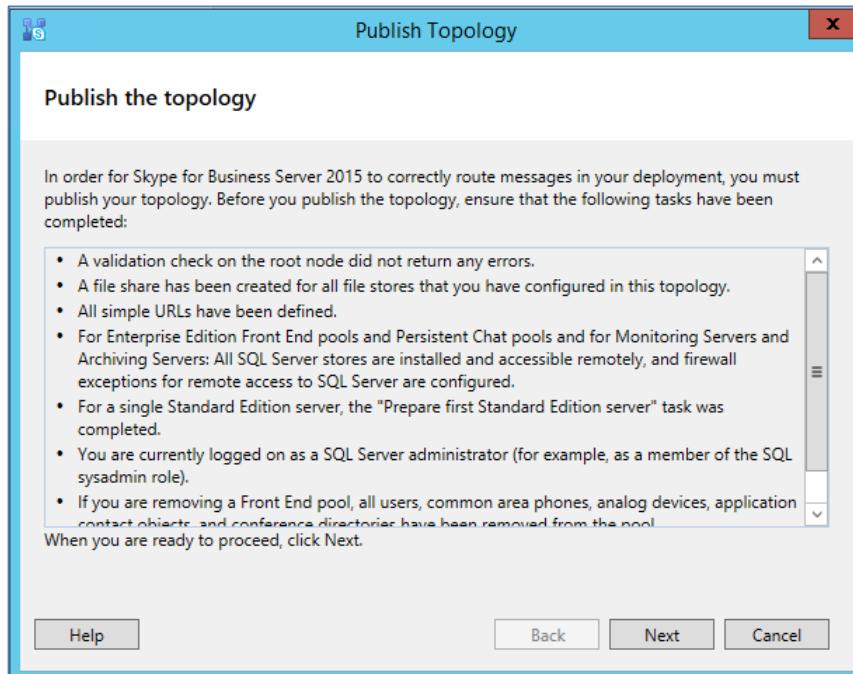

9. Publish the Topology: In the main tree, select the root node **Skype for Business Server**, and then from the **Action** menu, choose **Publish Topology**, as shown below:

Figure 3-10: Choosing Publish Topology

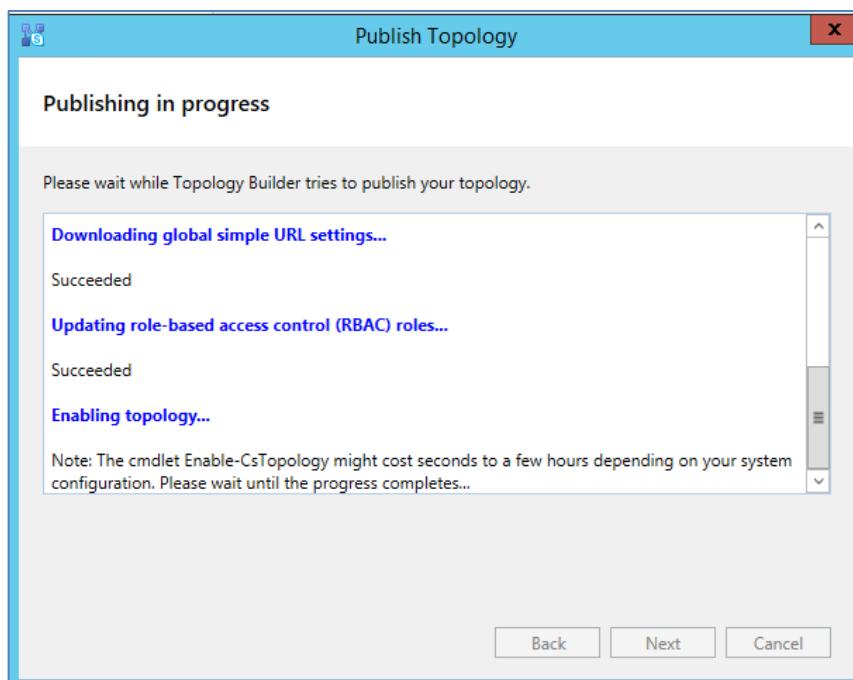

The following is displayed:

Figure 3-11: Publish the Topology

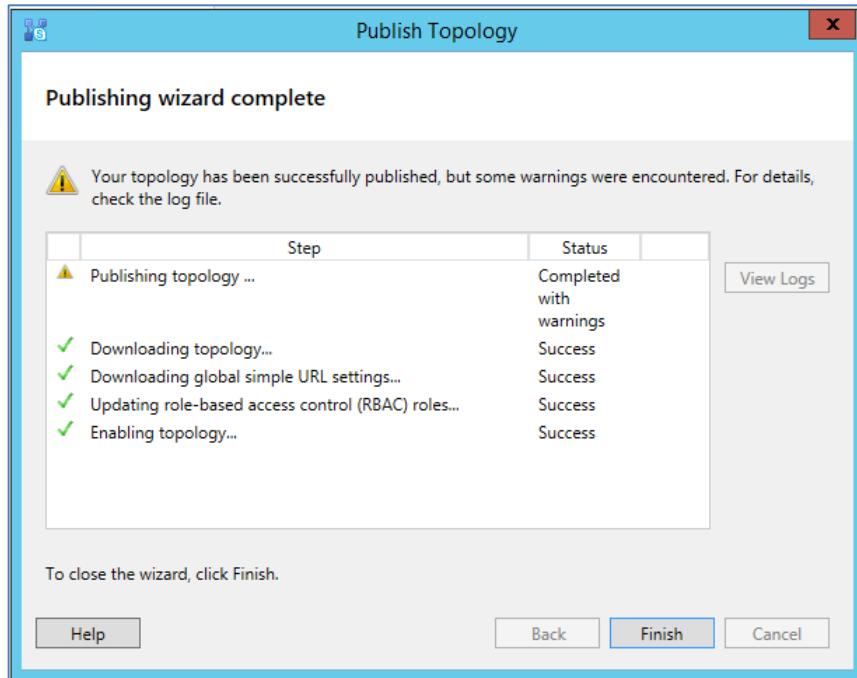

10. Click **Next**; the Topology Builder starts to publish your topology, as shown below:

Figure 3-12: Publishing in Progress

- 11.** Wait until the publishing topology process completes successfully, as shown below:

Figure 3-13: Publishing Wizard Complete

- 12.** Click **Finish**.

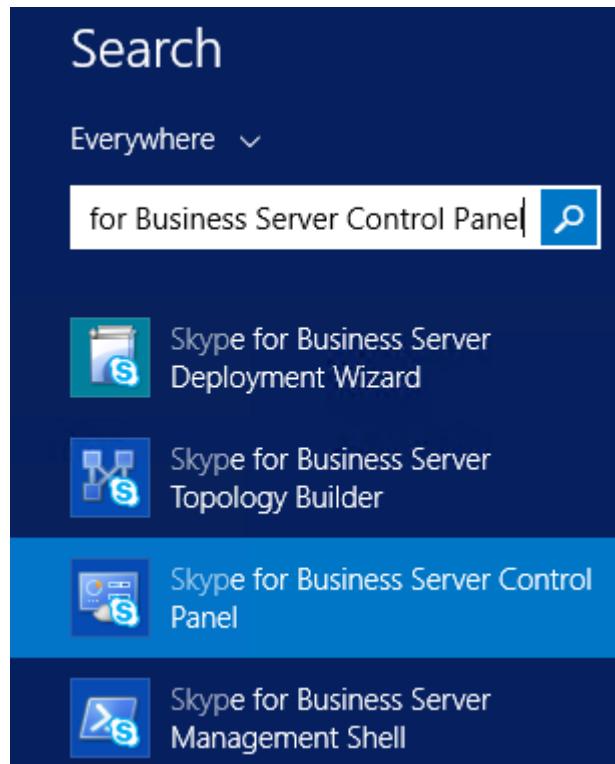

3.2 Configuring the "Route" on Skype for Business Server 2015

The procedure below describes how to configure a "Route" on the Skype for Business Server 2015 and to associate it with the E-SBC PSTN gateway.

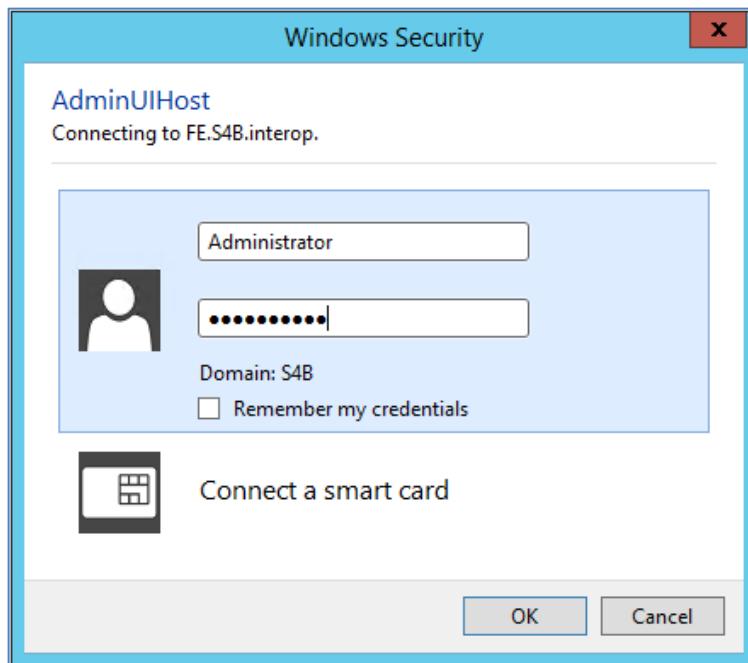

- **To configure the "route" on Skype for Business Server 2015:**

1. Start the Microsoft Skype for Business Server 2015 Control Panel (**Start** > search for **Microsoft Skype for Business Server Control Panel**), as shown below:

Figure 3-14: Opening the Skype for Business Server Control Panel

2. You are prompted to enter your login credentials:

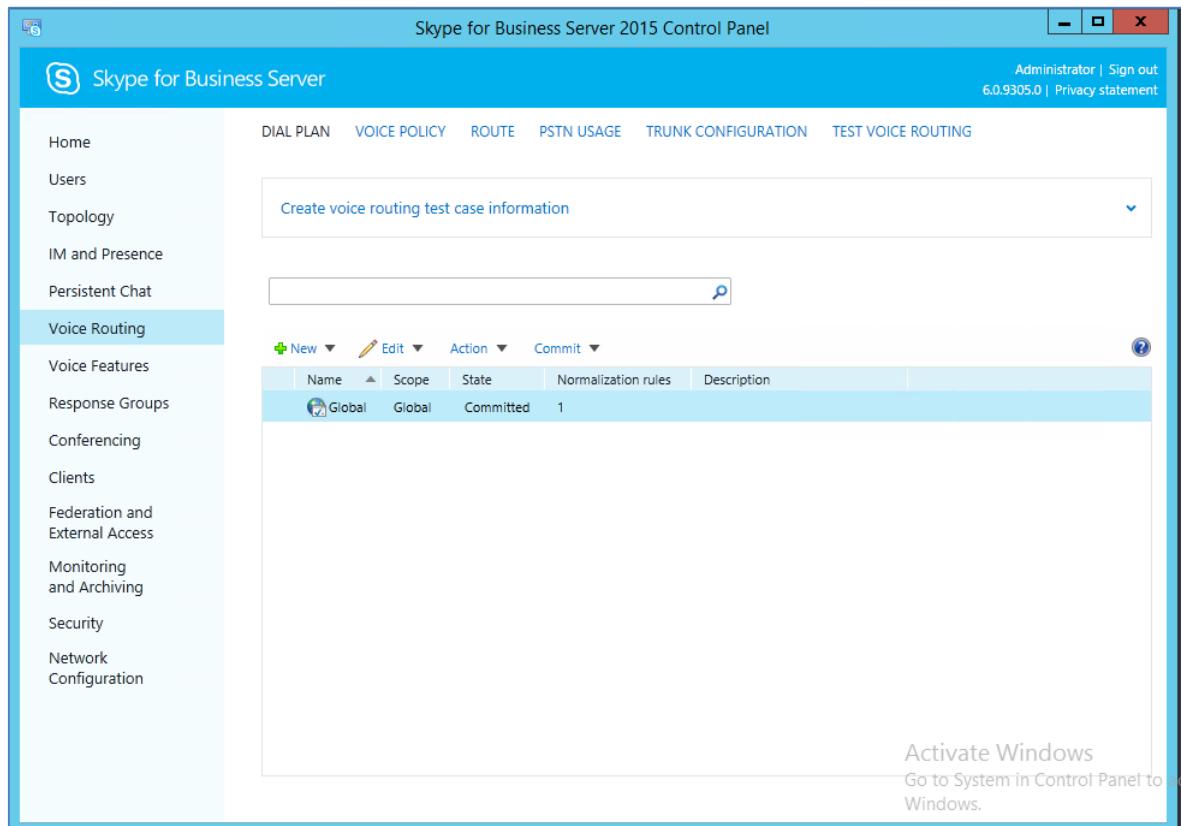

Figure 3-15: Skype for Business Server Credentials

3. Enter your domain username and password, and then click **OK**; the Microsoft Skype for Business Server 2015 Control Panel is displayed:

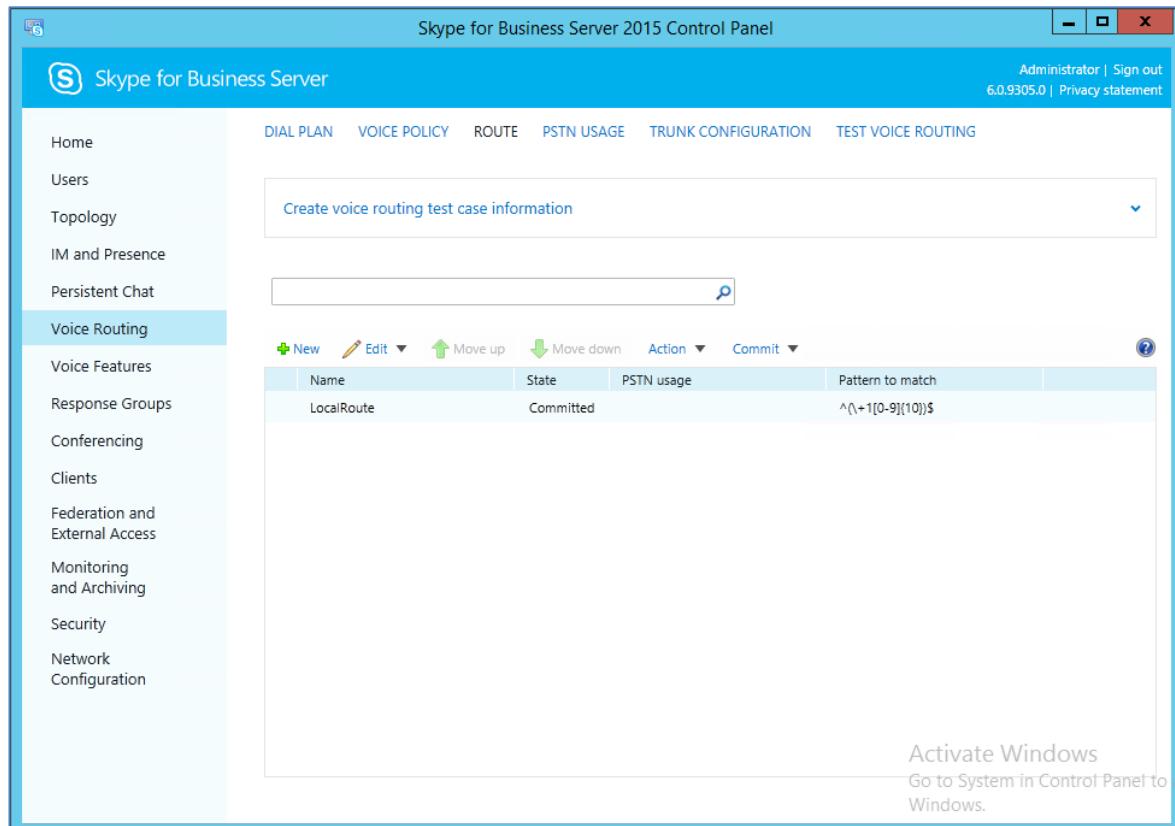

Figure 3-16: Microsoft Skype for Business Server 2015 Control Panel

The Microsoft Skype for Business Server 2015 Control Panel interface. The title bar says "Skype for Business Server 2015 Control Panel". The top right shows "Administrator | 6.0.9305.0 | Privacy statement". The left navigation pane includes links for Home, Users, Topology, IM and Presence, Persistent Chat, Voice Routing, Voice Features, Response Groups, Conferencing, Clients, Federation and External Access, Monitoring and Archiving, Security, and Network Configuration. The main content area features a "Welcome, Administrator" section with a "View your roles" link. It also includes "Top Actions" with links for "Enable users for Skype for Business Server", "Edit or move users", "View topology status", and "View Monitoring reports". A "Connection to Skype for Business Online" section with links for "Check recommendations from Office 365", "Sign in to Office 365", and "Set up hybrid with Skype for Business Online". On the right side, there are sections for "Getting Started" (with links to First Run Checklist, Using Control Panel, Skype for Business Server 2015, and Using Office 365), "Getting Help" (with links to Online Documentation on TechNet Library, Skype for Business Server Management Shell, Skype for Business Server Management Shell Script Library, and Skype for Business Server Resource Kit Tools), "Community" (with links to Forums and Blogs), and a "Activate Windows" section at the bottom right.

4. In the left navigation pane, select **Voice Routing**.

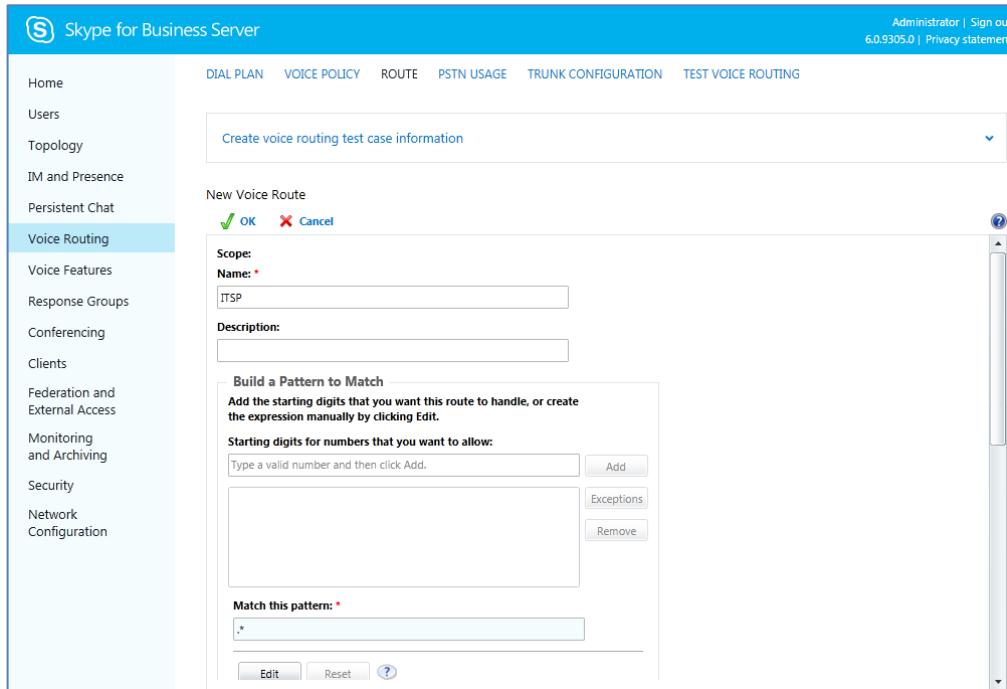

Figure 3-17: Voice Routing Page

5. In the Voice Routing page, select the **Route** tab.

Figure 3-18: Route Tab

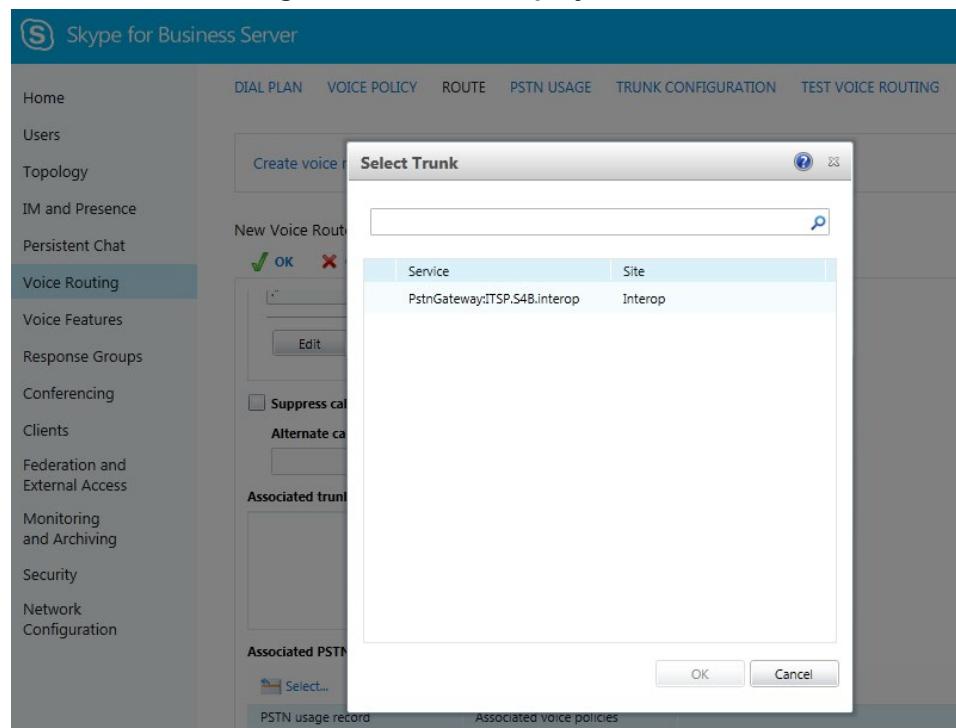

6. Click **New**; the New Voice Route page appears:

Figure 3-19: Adding New Voice Route

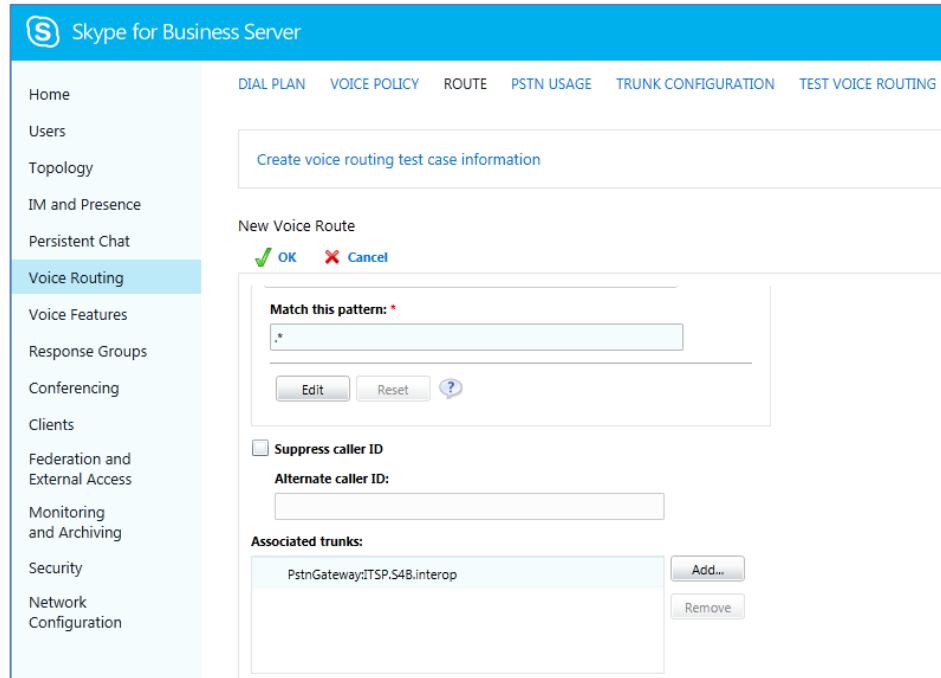

7. In the 'Name' field, enter a name for this route (e.g., ITSP).
8. In the 'Starting digits for numbers that you want to allow' field, enter the starting digits you want this route to handle (e.g., * to match all numbers), and then click Add.
9. Associate the route with the E-SBC Trunk that you created:
 - a. Under the 'Associated Trunks' group, click Add; a list of all the deployed gateways is displayed:

Figure 3-20: List of Deployed Trunks

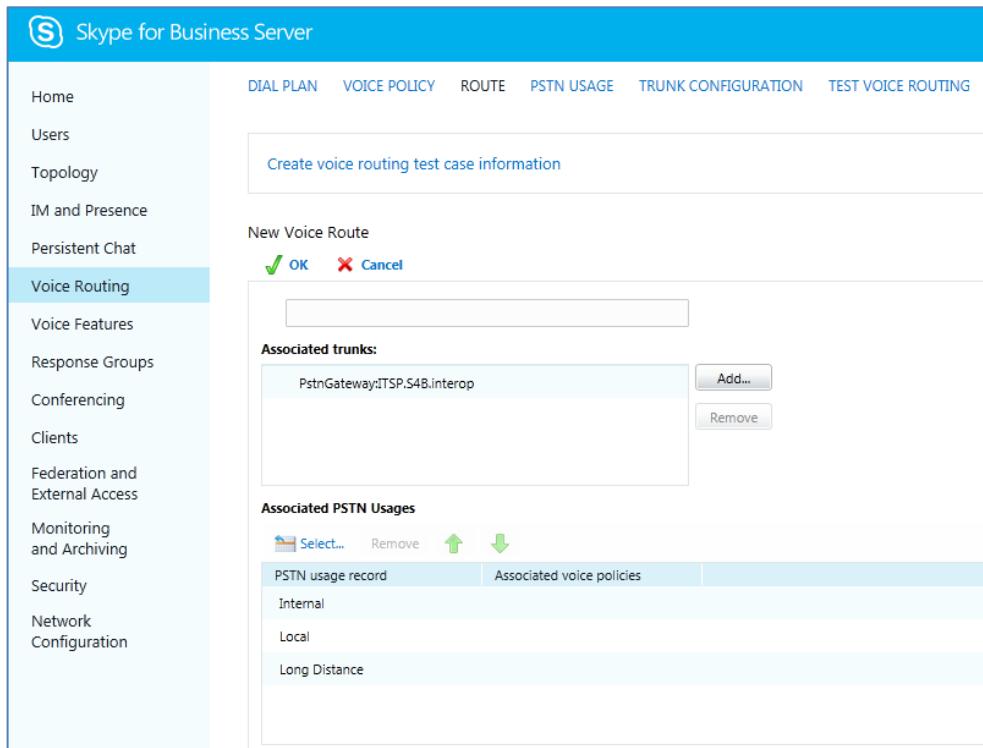

- b.** Select the E-SBC Trunk you created, and then click OK; the trunk is added to the 'Associated Trunks' group list:
- c.** Select the E-SBC Trunk you created, and then click OK; the trunk is added to the 'Associated Trunks' group list:

Figure 3-21: Selected E-SBC Trunk

10. Associate a PSTN Usage to this route:

11. Under the 'Associated PSTN Usages' group, click **Select** and then add the associated PSTN Usage.

Figure 3-22: Associating PSTN Usage to Route

- 12.** Click **OK** (located on the top of the New Voice Route page); the New Voice Route (Uncommitted) is displayed:

Figure 3-23: Confirmation of New Voice Route

Name	State	PSTN usage	Pattern to match
LocalRoute	Committed		^(\+1[0-9]{10})\$
ITSP	Uncommitted	Internal	^((\+66) (66))

- 13.** From the 'Commit' drop-down list, select **Commit all**, as shown below:

Figure 3-24: Committing Voice Routes

Name	State	PSTN usage	Pattern to match
LocalRoute	Committed		^(\+1[0-9]{10})\$
ITSP	Uncommitted	Internal	^((\+66) (66))

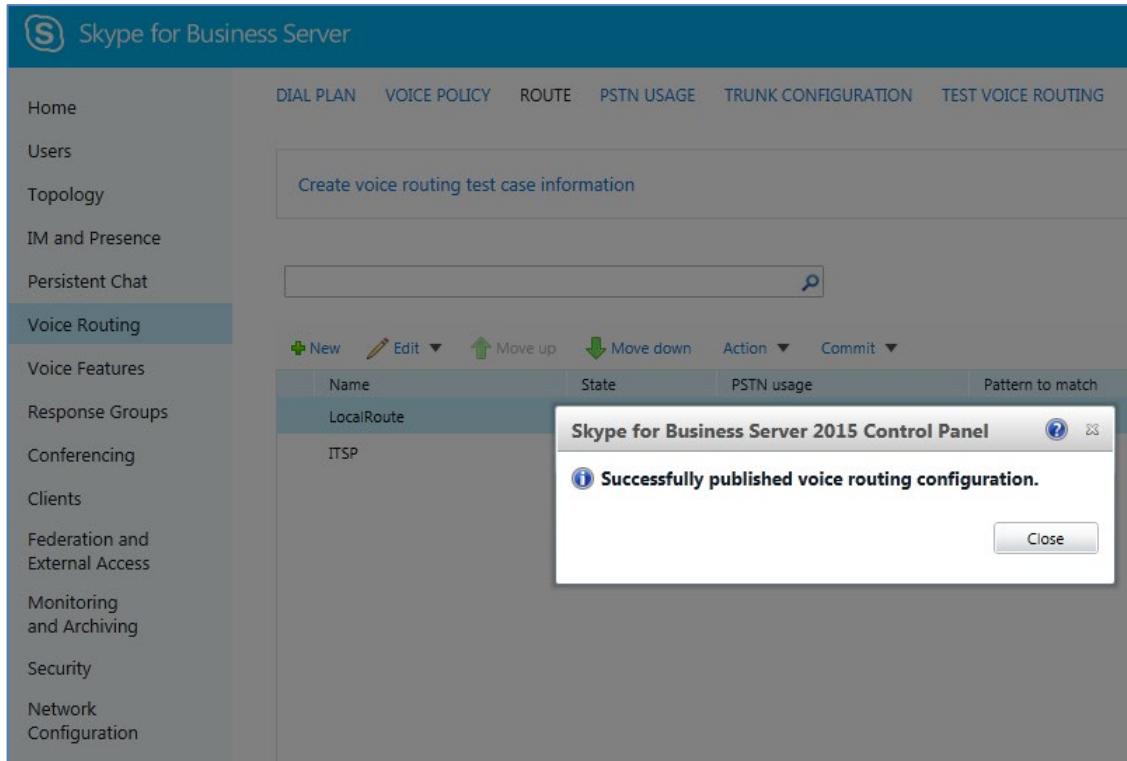

The Uncommitted Voice Configuration Settings page appears:

Figure 3-25: Uncommitted Voice Configuration Settings

Identity	Action	New value (pattern to match)	Old value (pattern to match)
ITSP	Added	^((\+66) (66))	

- 14.** Click **Commit**; a message is displayed confirming a successful voice routing configuration, as shown below:

Figure 3-26: Confirmation of Successful Voice Routing Configuration

- 15.** Click **Close**; the new committed Route is displayed in the Voice Routing page, as shown below:

Figure 3-27: Voice Routing Screen Displaying Committed Routes

The screenshot shows the 'Voice Routing' section of the Skype for Business Server 2015 Control Panel. The table displays the same two committed routes as in Figure 3-26: 'LocalRoute' and 'ITSP'. Both routes have their 'State' set to 'Committed' and their 'PSTN usage' fields filled with the respective patterns.

Name	State	PSTN usage	Pattern to match
LocalRoute	Committed		^(\+1[0-9]{10})\$
ITSP	Committed	Internal	^((\+66) (66))

- 16.** For ITSPs that implement a call identifier, continue with the following steps:

Note: The SIP History-Info header provides a method to verify the identity (ID) of the call forwarder (i.e., the Skype for Business user number). This ID is required by Swisscom SIP Trunk in the P-Asserted-Identity header. The device adds this ID to the P-Asserted-Identity header in the sent INVITE message using the IP Profile (see Section 4.6 on page 46).

- In the Voice Routing page, select the **Trunk Configuration** tab. Note that you can add and modify trunk configuration by site or by pool.

Figure 3-28: Voice Routing Screen – Trunk Configuration Tab 1

Name	Scope	State	Media bypass	PSTN usage	Calling number rules	Called number rules
Global	Global	Committed			0	0

- Click **Edit**; the Edit Trunk Configuration page appears:

Figure 3-29: Voice Routing Screen – Trunk Configuration Tab 2

- Select the **Enable forward call history** check box, and then click **OK**.

- d. Repeat Steps 11 through 13 to commit your settings.
17. Use the following command on the Skype for Business Server Management Shell after reconfiguration to verify correct values:
- **Get-CsTrunkConfiguration**

```
Identity :  
Service:PstnGateway:ITSP.S4B.interop  
OutboundTranslationRulesList :  
SipResponseCodeTranslationRulesList : {}  
OutboundCallingNumberTranslationRulesList : {}  
PstnUsages : {}  
Description :  
ConcentratedTopology : True  
EnableBypass : True  
EnableMobileTrunkSupport : False  
EnableReferSupport : True  
EnableSessionTimer : False  
EnableSignalBoost : False  
MaxEarlyDialogs : 20  
RemovePlusFromUri : False  
RTCPActiveCalls : False  
RTCPCallsOnHold : False

:
```

Note: When disabling the session timer as well as RTCPActiveCalls and RTCPCallsOnHold, a warning will appear which you can ignore. Swisscom Enterprise SIP core is handling the session timer. If you have another PBX connected to the SBC which needs a session timer, you will need to configure the IP profile of this endpoint to support it (Session Expires=Supported). This way the AudioCodes SBC will handle the session timer between the Skype for Business pool and the PBX.

This page is intentionally left blank.

4 Configuring AudioCodes E-SBC

This chapter provides step-by-step procedures on how to configure AudioCodes E-SBC for interworking between Microsoft Skype for Business Server 2015 and the Swisscom SIP Trunk. These configuration procedures are based on the interoperability test topology described in Section 2.4 on page 10, and includes the following main areas:

- E-SBC WAN interface - Swisscom SIP Trunking environment
- E-SBC LAN interface - Skype for Business Server 2015 environment

This configuration is done using the E-SBC's embedded Web server (hereafter, referred to as *Web interface*).

Notes:

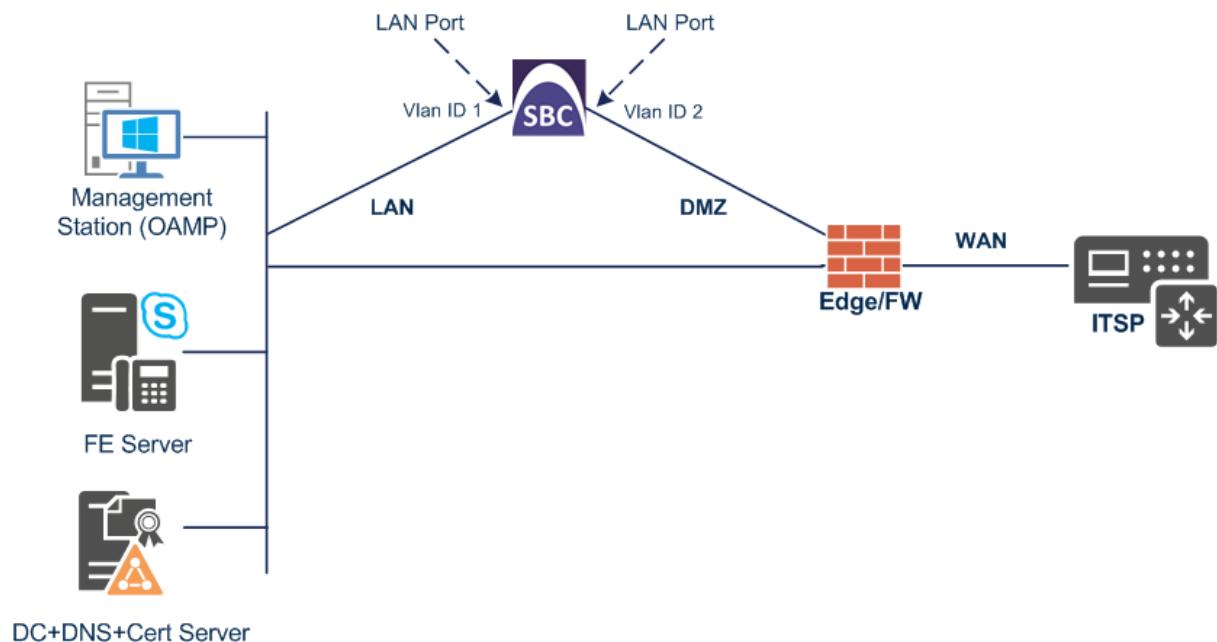

- For implementing Microsoft Skype for Business and Swisscom SIP Trunk based on the configuration described in this section, AudioCodes E-SBC must be installed with a License Key that includes the following software features:
 - ✓ Microsoft
 - ✓ SBC
 - ✓ Security
 - ✓ DSP
 - ✓ RTP
 - ✓ SIP
- For more information about the License Key, contact your AudioCodes sales representative.
- The scope of this interoperability test and document does **not** cover all security aspects for connecting the SIP Trunk to the Microsoft Skype for Business environment. Comprehensive security measures should be implemented per your organization's security policies. For security recommendations on AudioCodes' products, refer to the *Recommended Security Guidelines* document.

4.1 Step 1: IP Network Interfaces Configuration

This step describes how to configure the E-SBC's IP network interfaces. There are several ways to deploy the E-SBC; however, this interoperability test topology employs the following deployment method:

- E-SBC interfaces with the following IP entities:
 - Skype for Business servers, located on the LAN
 - Swisscom SIP Trunk, located on the WAN
- E-SBC connects to the WAN through a DMZ network
- Physical connection: The type of physical connection to the LAN depends on the method used to connect to the Enterprise's network. In the interoperability test topology, E-SBC connects to the LAN and DMZ using dedicated LAN ports (i.e., two ports and two network cables are used).
- E-SBC also uses two logical network interfaces:
 - LAN (VLAN ID 1)
 - DMZ (VLAN ID 2)

Figure 4-1: Network Interfaces in Interoperability Test Topology

4.1.1 Step 1a: Configure VLANs

This step describes how to define VLANs for each of the following interfaces:

- LAN VoIP (assigned the name "LAN_IF")
- WAN VoIP (assigned the name "WAN_IF")

➤ **To configure the VLANs:**

1. Open the Ethernet Device table (**Setup** menu > **IP Network** tab > **Core Entities** folder > **Ethernet Devices**).
2. There will be one existing row for VLAN ID 1 and underlying interface GROUP_1.
3. Add another VLAN ID 2 for the WAN side as follows:

Parameter	Value
Index	1
VLAN ID	2
Underlying Interface	GROUP_2 (Ethernet port group)
Name	vlan 2
Tagging	Untagged

Figure 4-2: Configured VLAN IDs in Ethernet Device

Ethernet Devices (2)				
+ New	Edit	Page 1 of 1	Show 10 records per page	Search
INDEX	VLAN ID	UNDERLYING INTERFACE	NAME	TAGGING
0	1	GROUP_1	vlan 1	Untagged
1	2	GROUP_2	vlan 2	Untagged

4.1.2 Step 1b: Configure Network Interfaces

This step describes how to configure the IP network interfaces for each of the following interfaces:

- LAN VoIP (assigned the name "LAN_IF")
- WAN VoIP (assigned the name "WAN_IF")

➤ **To configure the IP network interfaces:**

1. Open the IP Interfaces table (**Setup** menu > **IP Network** tab > **Core Entities** folder > **IP Interfaces**).
2. Modify the existing LAN network interface:
 - a. Select the 'Index' radio button of the **OAMP + Media + Control** table row, and then click **Edit**.
 - a. Configure the interface as follows:

Parameter	Value
Name	Voice (arbitrary descriptive name)
Ethernet Device	vlan 1

IP Address	10.15.77.77 (LAN IP address of E-SBC)
Prefix Length	16 (subnet mask in bits for 255.255.0.0)
Default Gateway	10.15.0.1
Primary DNS	10.15.27.1

3. Add a network interface for the WAN side:

- a. Click **New**.
- b. Configure the interface as follows:

Parameter	Value
Name	WANSP
Application Type	Media + Control
Ethernet Device	vlan 2
IP Address	192.168.77.77 (DMZ IP address of E-SBC)
Prefix Length	25 (subnet mask in bits for 255.255.255.128)
Default Gateway	192.168.77.1 (router's IP address)
Primary DNS	192.168.77.1

4. Click **Apply**; the configured IP network interfaces are shown below:

Figure 4-3: Configured Network Interfaces in IP Interfaces Table

IP Interfaces (2)									
INDEX	NAME	APPLICATION TYPE	INTERFACE MODE	IP ADDRESS	PREFIX LENGTH	DEFAULT GATEWAY	PRIMARY DNS	SECONDARY DNS	ETHERNET DEVICE
0	Voice	OAMP + Media +	IPv4 Manual	10.15.77.77	16	10.15.0.1	10.15.27.1	0.0.0.0	vlan 1
1	WANSP	Media + Control	IPv4 Manual	192.168.77.77	25	192.168.77.1	192.168.77.1	0.0.0.0	vlan 2

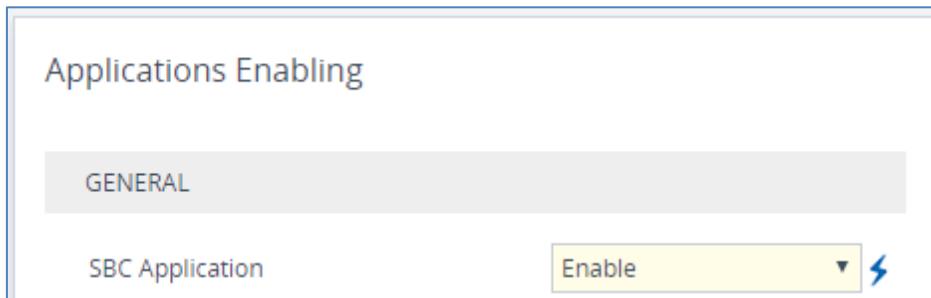

4.2 Step 2: Enable the SBC Application

This step describes how to enable the SBC application (if it is required).

➤ **To enable the SBC application:**

1. Open the Applications Enabling page (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Applications Enabling**).

Figure 4-4: Enabling SBC Application

2. From the 'SBC Application' drop-down list, select **Enable**.
3. Click **Apply**.
4. Reset the E-SBC with a burn to flash for this setting to take effect (see Section 4.16 on page 102).

4.3 Step 3: Configure Media Realms

This step describes how to configure Media Realms. The simplest configuration is to create two Media Realms - one for internal (LAN) traffic and one for external (WAN) traffic.

➤ **To configure Media Realms:**

1. Open the Media Realms table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Media Realms**).
2. Add a Media Realm for the LAN interface. You can use the default Media Realm (Index 0), but modify it as shown below:

Parameter	Value
Index	0
Name	MRLan (descriptive name)
IPv4 Interface Name	Voice
Port Range Start	6000 (represents lowest UDP port number used for media on LAN)
Number of Media Session Legs	100 (media sessions assigned with port range)

Figure 4-5: Configuring Media Realm for LAN

The screenshot shows the 'Media Realms [MRLan]' configuration window. It has two main tabs: 'GENERAL' and 'QUALITY OF EXPERIENCE'. The 'GENERAL' tab contains the following settings:

- Index: 0
- Name: MRLan
- Topology Location: Down
- IPv4 Interface Name: #0 [Voice] (with a 'View' link)
- Port Range Start: 6000
- Number Of Media Session Legs: 100
- Port Range End: 6999
- Default Media Realm: Yes

The 'QUALITY OF EXPERIENCE' tab contains:

- QoE Profile: -- (with a 'View' link)
- Bandwidth Profile: -- (with a 'View' link)

At the bottom of the window are 'Cancel' and 'APPLY' buttons.

3. Configure a Media Realm for WAN traffic:

Parameter	Value
Index	1
Name	MRWan (arbitrary name)
Topology Location	Up
IPv4 Interface Name	WANSP
Port Range Start	7000 (represents lowest UDP port number used for media on WAN)
Number of Media Session Legs	100 (media sessions assigned with port range)

Figure 4-6: Configuring Media Realm for WAN

Media Realms [MRWan]

GENERAL		QUALITY OF EXPERIENCE	
Index	1	QoE Profile	-- View
Name	• MRWan	Bandwidth Profile	-- View
Topology Location	• Up		
IPv4 Interface Name	• #1 [WANSP] View		
Port Range Start	• 7000		
Number Of Media Session Legs	100		
Port Range End	7999		
Default Media Realm	No		

Cancel **APPLY**

The configured Media Realms are shown in the figure below:

Figure 4-7: Configured Media Realms in Media Realm Table

Media Realms (2)						
	+ New	Edit	Delete	Page 1 of 1	Show 10 records per page	Search
INDEX	NAME	IPV4 INTERFACE NAME	PORT RANGE START	NUMBER OF MEDIA SESSION LEGS	PORT RANGE END	DEFAULT MEDIA REALM
0	MRLan	Voice	6000	100	6999	No
1	MRWan	WANSP	7000	100	7999	No

4.4 Step 4: Configure SIP Signaling Interfaces

This step describes how to configure SIP Interfaces. For the interoperability test topology, an internal and external SIP Interface must be configured for the E-SBC.

➤ **To configure SIP Interfaces:**

1. Open the SIP Interfaces table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **SIP Interfaces**).
2. Add a SIP Interface for the LAN interface. You can use the default SIP Interface (Index 0), but modify it as shown below:

Parameter	Value
Index	0
Name	S4B (see note at the end of this section)
Network Interface	Voice
Application Type	SBC
UDP Port (for supporting Fax ATA device)	5060
TCP	0
TLS Port	5067 (see note below)
Media Realm	MRLan

Note: The TLS port parameter must be identically configured in the Skype for Business Topology Builder (see Section 3.1 on page 13).

3. Configure a SIP Interface for the WAN:

Parameter	Value
Index	1
Name	Swisscom
Network Interface	WANSP
Application Type	SBC
TCP Port	5060
UDP and TLS	0
Media Realm	MRWan

The configured SIP Interfaces are shown in the figure below:

Figure 4-8: Configured SIP Interfaces in SIP Interface Table

SIP Interfaces (2)									
		+ New Edit 		Page 1 of 1		Show 10 records per page		<input type="text"/> 	
INDEX	NAME	SRD	NETWORK INTERFACE	APPLICATION TYPE	UDP PORT	TCP PORT	TLS PORT	ENCAPSULATIN PROTOCOL	MEDIA REALM
0	S4B	 DefaultSRD	Voice	SBC	5060	0	5067	No encapsulatio	MRLan
1	Swisscom	 DefaultSRD	WANSP	SBC	0	5060	0	No encapsulatio	MRWan

Note: Current software releases uses the string **names** of the configuration entities (e.g., SIP Interface, Proxy Sets, and IP Groups). Therefore, it is recommended to configure each configuration entity with meaningful names for easy identification.

4.5 Step 5: Configure Proxy Sets

This step describes how to configure Proxy Sets. The Proxy Set defines the destination address (IP address or FQDN) of the IP entity server. Proxy Sets can also be used to configure load balancing between multiple servers.

For the interoperability test topology, two Proxy Sets need to be configured for the following IP entities:

- Microsoft Skype for Business Server 2015
- Swisscom SIP Trunk
- Fax supporting ATA device

The Proxy Sets will be later applying to the VoIP network by assigning them to IP Groups.

➤ To configure Proxy Sets:

1. Open the Proxy Sets table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder >**Proxy Sets**).
2. Add a Proxy Set for the Skype for Business Server 2015 as shown below:

Parameter	Value
Index	1
Name	S4B
SBC IPv4 SIP Interface	S4B
Proxy Keep-Alive	Using Options
Redundancy Mode	Homing
Proxy Hot Swap	Enable
Proxy Load Balancing Method	Round Robin

Figure 4-9: Configuring Proxy Set for Microsoft Skype for Business Server 2015

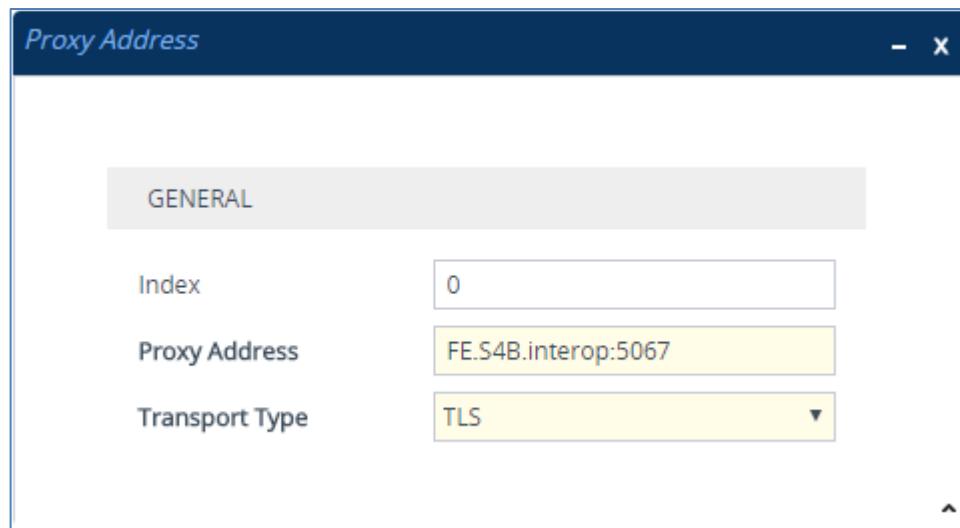

GENERAL		REDUNDANCY	
Index	0	Redundancy Mode	• Homing
Name	• S4B	Proxy Hot Swap	• Enable
Gateway IPv4 SIP Interface	— View	Proxy Load Balancing Method	• Round Robin
SBC IPv4 SIP Interface	• #0 [S4B] View	Min. Active Servers for Load Balancing	1
TLS Context Name	— View		

ADVANCED	
Classification Input	IP Address only
DNS Resolve Method	—

KEEP ALIVE	
Proxy Keep-Alive	• Using OPTIONS
Proxy Keep-Alive Time [sec]	60
Keep-Alive Failure Responses	—

- a. Select the index row of the Proxy Set that you added, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.
- b. Click **New**; the following dialog box appears:

Figure 4-10: Configuring Proxy Address for Microsoft Skype for Business Server 2015

- c. Configure the address of the Proxy Set according to the parameters described in the table below.
- d. Click **Apply**.

Parameter	Value
Index	0
Proxy Address	FE.S4B.interop:5067 (Skype for Business Server 2015 IP address / FQDN and destination port)
Transport Type	TLS

3. Configure a Proxy Set for the Swisscom SIP Trunk.

Parameter	Value
Index	2
Name	Swisscom
SBC IPv4 SIP Interface	Swisscom
Proxy Keep-Alive	Using Options
Proxy Keep-Alive Time [sec]	10 (according to Swisscom requirement)

Figure 4-11: Configuring Proxy Set for Swisscom SIP Trunk

- a. Select the index row of the Proxy Set that you added, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.
- b. Click **New**; the following dialog box appears:

Figure 4-12: Configuring Proxy Address for Swisscom SIP Trunk

- c. Configure the address of the Proxy Set according to the parameters described in the table below.
- d. Click **Apply**.

Parameter	Value
Index	0
Proxy Address	10.254.151.2:5060 (IP address / FQDN and destination port)

Transport Type	TCP
----------------	-----

4. Configure a Proxy Set for Fax supporting ATA device (if required):

Parameter	Value
Index	3
Name	Fax
SBC IPv4 SIP Interface	S4B

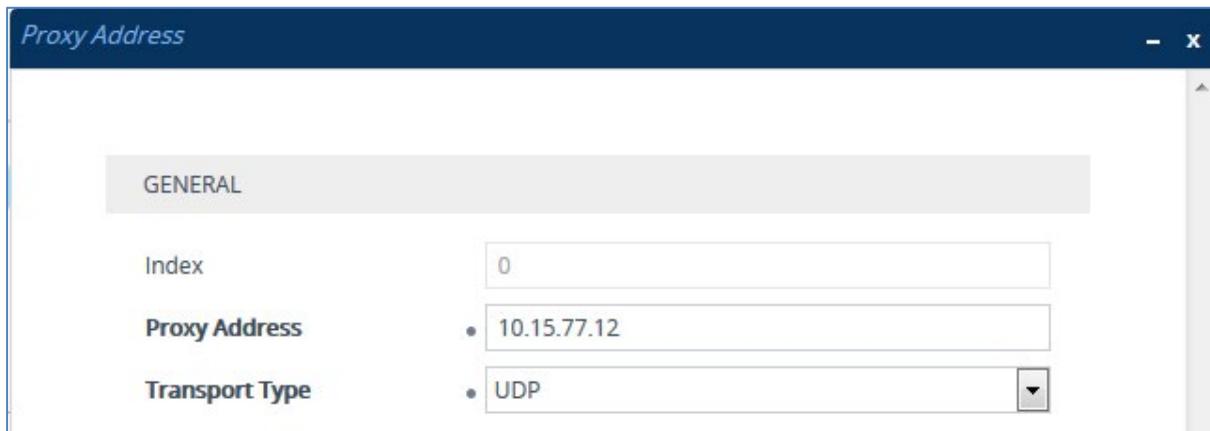

Figure 4-13: Configuring Proxy Set for Fax ATA device

SRD #0 [DefaultSRD]

GENERAL		REDUNDANCY

KEEP ALIVE			
Proxy Keep-Alive	Disable		
Proxy Keep-Alive Time [sec]	60		
Keep-Alive Failure Responses	Empty input field		

Cancel **APPLY**

- a. Select the index row of the Proxy Set that you added, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.
- b. Click **New**; the following dialog box appears:

Figure 4-14: Configuring Proxy Address for Fax ATA device

- c. Configure the address of the Proxy Set according to the parameters described in the table below.
- d. Click **Apply**.

Parameter	Value
Index	0
Proxy Address	10.15.77.12 (IP address / FQDN and destination port)
Transport Type	UDP

The configured Proxy Sets are shown in the figure below:

Figure 4-15: Configured Proxy Sets in Proxy Sets Table

Proxy Sets (3)							
INDEX	NAME	SRD	GATEWAY IPV4 SIP INTERFACE	SBC IPV4 SIP INTERFACE	PROXY KEEP-ALIVE TIME [SEC]	REDUNDANCY MODE	PROXY HOT SWAP
0	S4B	DefaultSRD (#0) --		S4B	60	Homing	Enable
1	Swisscom	DefaultSRD (#0) --		Swisscom	10		Disable
2	Fax	DefaultSRD (#0) --		S4B	60		Disable

4.6 Step 6: Configure Coders

This step describes how to configure coders (termed *Coder Group*). As Skype for Business Server 2015 clients supports a range of coders, while the network connection to Swisscom SIP Trunk may restrict operation to only specific coders such as G.711, you need to add a Coder Group with the G.711 coder for the Swisscom SIP Trunk.

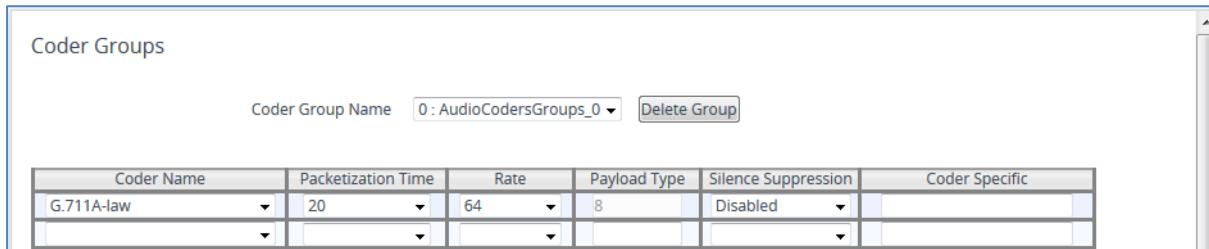

Note that the Coder Group ID for this entity will be assigned to its corresponding IP Profile in the next step (see Section 4.7).

➤ **To configure coders:**

1. Open the Coder Groups table (**Setup menu > Signaling & Media tab > Coders & Profiles folder > Coder Groups**).
2. Configure a Coder Group for Swisscom SIP Trunk:

Parameter	Value
Coder Group Name	AudioCodersGroups_0
Coder Name	G.711A-law

Figure 4-16: Configuring Coder Group for Swisscom SIP Trunk

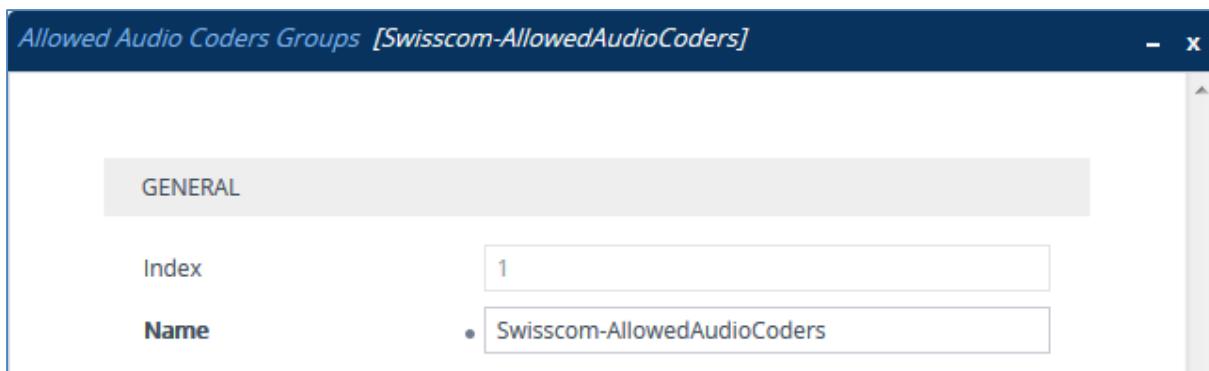

The procedure below describes how to configure an Allowed Coders Group to ensure that voice sent to the Swisscom SIP Trunk uses the G.729 coder whenever possible. Note that this Allowed Coders Group ID will be assigned to the IP Profile belonging to the Swisscom SIP Trunk in the next step.

➤ **To set a preferred coder for the Swisscom SIP Trunk:**

1. Open the Allowed Audio Coders Groups table (**Setup menu > Signaling & Media tab > Coders & Profiles folder > Allowed Audio Coders Groups**).
2. Click **New** and configure a name for the Allowed Audio Coders Group for Swisscom SIP Trunk.

Figure 4-17: Configuring Allowed Coders Group for Swisscom SIP Trunk

3. Click **Apply**.

4. Select the new row that you configured, and then click the **Allowed Audio Coders** link located below the table; the Allowed Audio Coders table opens.
5. Click **New** and configure an Allowed Coders as follows:

Parameter	Value
Index	0
Coder	G.711A-law
Index	1
Coder	G.729
Index	2
Coder	G.722

Figure 4-18: Configuring Allowed Coders for Swisscom SIP Trunk

The screenshot shows a web-based configuration interface for 'Allowed Audio Coders'. At the top left is a back arrow and the text 'Allowed Audio Coders Groups [#1] > Allowed Audio Coders (3)'. Below this is a toolbar with buttons for '+ New', 'Edit', and a trash icon. To the right is a search bar and a page navigation section showing 'Page 1 of 1' and 'Show 10 records per page'. The main area is a table with three rows. The columns are labeled 'INDEX', 'CODER', and 'USER-DEFINED CODER'. The data rows are: Row 0: INDEX 0, CODER G.711A-law, USER-DEFINED CODER (empty); Row 1: INDEX 1, CODER G.729, USER-DEFINED CODER (empty); Row 2: INDEX 2, CODER G722, USER-DEFINED CODER (empty).

INDEX	CODER	USER-DEFINED CODER
0	G.711A-law	
1	G.729	
2	G722	

6. Open the Media Settings page (**Setup** menu > **Signaling & Media** tab > **Media** folder > **Media Settings**).

Figure 4-19: SBC Preferences Mode

The screenshot shows the 'Media Settings' configuration page. At the top, there are two tabs: 'GENERAL' and 'ROBUSTNESS'. Under 'GENERAL', several settings are listed: 'NAT Traversal' (Disable NAT), 'Enable Continuity Tones' (Disable), 'Inbound Media Latch Mode' (Dynamic), 'Number of Media Channels' (0), 'Enforce Media Order' (Disable), and 'SDP Session Owner' (AudiocodesGW). To the right of these are corresponding numerical values: 'New RTP Stream Packets' (3), 'New RTCP Stream Packets' (3), 'New SRTP Stream Packets' (3), 'New SRTCP Stream Packets' (3), 'Timeout To Relatch RTP (msec)' (200), 'Timeout To Relatch SRTP (msec)' (200), 'Timeout To Relatch Silence (msec)' (10000), and 'Timeout To Relatch RTCP (msec)' (10000). Below the 'GENERAL' tab is a 'SBC SETTINGS' tab. Under 'SBC SETTINGS', there are two dropdown menus: 'Preferences Mode' (set to 'Include Extensions') and 'Enforce Media Order' (Disable). An arrow points to the 'Include Extensions' dropdown. At the bottom of the page are 'Cancel' and 'APPLY' buttons.

7. From the 'Preferences Mode' drop-down list, select **Include Extensions**.
8. Click **Apply**.

4.7 Step 7: Configure IP Profiles

This step describes how to configure IP Profiles. The IP Profile defines a set of call capabilities relating to signaling (e.g., SIP message terminations such as REFER) and media (e.g., coder and transcoding method).

In this interoperability test topology, IP Profiles need to be configured for the following IP entities:

- Microsoft Skype for Business Server 2015 – to operate in secure mode using SRTP and SIP over TLS
- Swisscom SIP trunk – to operate in non-secure mode using RTP and SIP over TCP
- Fax ATA device – to operate in non-secure mode using RTP and SIP over UDP

➤ **To configure IP Profile for the Skype for Business Server 2015:**

1. Open the IP Profiles table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **IP Profiles**).
2. Click **New**, and then configure the parameters as follows:

Parameter	Value
General	
Index	1
Name	S4B
Media Security	
SBC Media Security Mode	SRTP
Symmetric MKI	Enable
MKI Size	1
Enforce MKI Size	Enforce
Reset SRTP State Upon Re-key	Enable
Generate SRTP Keys Mode:	Always
SBC Early Media	
Remote Early Media RTP Detection Mode	By Media (required, as Skype for Business Server 2015 does not send RTP immediately to remote side when it sends a SIP 18x response)
SBC Media	
Allowed Media Types	audio
RTCP Mode	Generate Always
SBC Signaling	
PRACK Mode	Optional
Remote Update Support	Supported Only After Connect
Remote re-INVITE Support	Supported Only With SDP
Remote Delayed Offer Support	Not Supported
SBC Forward and Transfer	

Remote REFER Mode	Handle Locally (required, as Skype for Business Server 2015 does not support receipt of SIP REFER)
Remote 3xx Mode	Handle Locally (required, as Skype for Business Server 2015 does not support receipt of SIP 3xx responses)
Media	
Broken Connection Mode	Ignore

Figure 4-20: Configuring IP Profile for Skype for Business Server 2015

GENERAL		SBC SIGNALING	
Index	1	PRACK Mode	Optional
Name	S4B	P-Asserted-Identity Header Mode	As Is
Created by Routing Server	No	Diversion Header Mode	As Is
MEDIA SECURITY		History-Info Header Mode	As Is
SBC Media Security Mode	SRTP	Session Expires Mode	Transparent
Gateway Media Security Mode	Preferable	Remote Update Support	Supported Only After Connec
Symmetric MKI	Enable	Remote re-INVITE	Supported only with SDP
MKI Size	1	Remote Delayed Offer Support	Not Supported
SBC Enforce MKI Size	Enforce	Remote Representation Mode	According to Operation Mode
SBC Media Security Method	SDES	Keep Incoming Via Headers	According to Operation Mode
		Keep Incoming Routing Headers	According to Operation Mode
		Keep User-Agent Header	According to Operation Mode

3. Click **Apply**.

➤ **To configure an IP Profile for the Swisscom SIP Trunk:**

1. Click **New**, and then configure the parameters as follows:

Parameter	Value
General	
Index	2
Name	Swisscom
Media Security	
SBC Media Security Mode	RTP
SBC Media	
Extension Coders Group	AudioCodersGroups_0
Allowed Audio Coders	Swisscom-AllowedAudioCoders
Allowed Coders Mode	Restriction and Preference (lists Allowed Coders only and re-arranges the priority of the coders according to Allowed Audio Coders Group order)
RFC 2833 DTMF Payload Type	101
SDP Ptime Answer	Preferred Value
Preferred PTime	20
RTCP Mode	Generate Always
SBC Signaling	
P-Asserted-Identity header Mode	Add (required for anonymous calls)
Diversion header Mode	Add (required for forwarded calls)
History-Info header Mode	Remove
SBC Forward and Transfer	
Remote REFER Mode	Handle Locally (required, as Skype for Business Server 2015 does not support receipt of SIP REFER)
Play RBT To Transferee	Yes
SBC Hold	
Remote Hold Format	Send Only
Media	
Broken Connection Mode	Ignore

Figure 4-21: Configuring IP Profile for Swisscom SIP Trunk

The screenshot shows the 'IP Profiles [Swisscom]' configuration window. It has three main sections: GENERAL, SBC SIGNALING, and MEDIA SECURITY.

GENERAL:

- Index: 2
- Name: Swisscom
- Created by Routing Server: No

SBC SIGNALING:

- PRACK Mode: Transparent
- P-Asserted-Identity Header Mode: Add
- Diversion Header Mode: Add
- History-Info Header Mode: Remove
- Session Expires Mode: Transparent
- Remote Update Support: Supported
- Remote re-INVITE: Supported
- Remote Delayed Offer Support: Supported
- Remote Representation Mode: According to Operation
- Keep Incoming Via Headers: According to Operation
- Keep Incoming Routing Headers: According to Operation
- Keep User-Agent Header: According to Operation

MEDIA SECURITY:

- SBC Media Security Mode: RTP
- Gateway Media Security Mode: Preferable
- Symmetric MKI: Disable
- MKI Size: 0
- SBC Enforce MKI Size: Don't enforce
- SBC Media Security Method: SDSE

At the bottom right are 'Cancel' and 'APPLY' buttons.

2. Click Apply.

➤ To configure an IP Profile for the FAX supporting ATA (if required):

1. Click **New** and then configure the parameters as follows:

Parameter	Value
Index	3
Profile Name	Fax

Figure 4-22: Configuring IP Profile for FAX ATA

The screenshot shows the 'IP Profiles [Fax]' configuration window. It has two main tabs: 'GENERAL' and 'SBC SIGNALING'. The 'GENERAL' tab contains fields for 'Index' (set to 3), 'Name' (set to 'Fax'), and 'Created by Routing Server' (set to 'No'). The 'SBC SIGNALING' tab contains various signaling mode settings, all set to their default values: PRACK Mode (Transparent), P-Asserted-Identity Header Mode (As Is), Diversion Header Mode (As Is), History-Info Header Mode (As Is), Session Expires Mode (Transparent), Remote Update Support (Supported), Remote re-INVITE (Supported), Remote Delayed Offer Support (Supported), Remote Representation Mode (According to Operation Mode), Keep Incoming Via Headers (According to Operation Mode), Keep Incoming Routing Headers (According to Operation Mode), and Keep User-Agent Header (According to Operation Mode). At the bottom of the window are 'Cancel' and 'APPLY' buttons.

2. All other parameters leave as Default.
3. Click **Apply**.

4.8 Step 8: Configure IP Groups

This step describes how to configure IP Groups. The IP Group represents an IP entity on the network with which the E-SBC communicates. This can be a server (e.g., IP PBX or ITSP) or it can be a group of users (e.g., LAN IP phones). For servers, the IP Group is typically used to define the server's IP address by associating it with a Proxy Set. Once IP Groups are configured, they are used to configure IP-to-IP routing rules for denoting source and destination of the call.

In this interoperability test topology, IP Groups must be configured for the following IP entities:

- Skype for Business Server 2015 (Mediation Server) located on LAN
- Swisscom SIP Trunk located on WAN
- Fax supporting ATA device located on LAN (if required)

➤ **To configure IP Groups:**

1. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
2. Add an IP Group for the Skype for Business Server 2015:

Parameter	Value
Index	1
Name	S4B
Type	Server
Proxy Set	S4B
IP Profile	S4B
Media Realm	MRLan
SIP Group Name	10.254.151.2 (according to ITSP requirement)

3. Configure an IP Group for the Swisscom SIP Trunk:

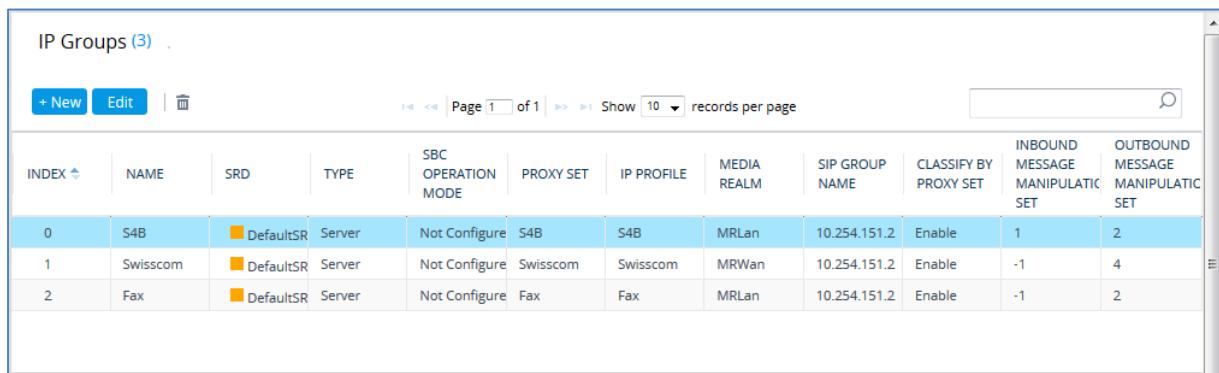

Parameter	Value
Index	2
Name	Swisscom
Topology Location	Up
Type	Server
Proxy Set	Swisscom
IP Profile	Swisscom
Media Realm	MRWan
SIP Group Name	10.254.151.2 (according to ITSP requirement)

4. Configure an IP Group for the Fax supporting ATA device.

Parameter	Value
Index	2
Name	Fax
Type	Server
Proxy Set	Fax
IP Profile	Fax
Media Realm	MRLan
SIP Group Name	10.254.151.2 (according to ITSP requirement)

The configured IP Groups are shown in the figure below:

Figure 4-23: Configured IP Groups in IP Group Table

The screenshot shows a web-based configuration interface for IP Groups. At the top, there's a header bar with buttons for '+ New', 'Edit', and a trash icon. Below the header, the title 'IP Groups (3)' is displayed. To the right of the title are buttons for 'Page 1 of 1', 'Show 10 records per page', and a search bar. The main area is a table with the following data:

INDEX	NAME	SRD	TYPE	SBC OPERATION MODE	PROXY SET	IP PROFILE	MEDIA REALM	SIP GROUP NAME	CLASSIFY BY PROXY SET	INBOUND MESSAGE MANIPULATION SET	OUTBOUND MESSAGE MANIPULATION SET
0	S4B	DefaultSR	Server	Not Configure	S4B	S4B	MRLan	10.254.151.2	Enable	1	2
1	Swisscom	DefaultSR	Server	Not Configure	Swisscom	Swisscom	MRWan	10.254.151.2	Enable	-1	4
2	Fax	DefaultSR	Server	Not Configure	Fax	Fax	MRLan	10.254.151.2	Enable	-1	2

4.9 Step 9: SIP TLS Connection Configuration

This section describes how to configure the E-SBC for using a TLS connection with the Skype for Business Server 2015 Mediation Server. This is essential for a secure SIP TLS connection.

4.9.1 Step 9a: Configure the NTP Server Address

This step describes how to configure the NTP server's IP address. It is recommended to implement an NTP server (Microsoft NTP server or a third-party server) to ensure that the E-SBC receives the accurate and current date and time. This is necessary for validating certificates of remote parties.

➤ **To configure the NTP server address:**

1. Open the Time & Date page (**Setup** menu > **Administration** tab > **Time & Date**).
2. In the 'Primary NTP Server Address' field, enter the IP address of the NTP server (e.g., **10.15.27.1**).

Figure 4-24: Configuring NTP Server Address

NTP SERVER	
Primary NTP Server Address (IP or FQDN)	• <input type="text" value="10.15.27.1"/>
Secondary NTP Server Address (IP or FQDN)	<input type="text"/>
NTP Update Interval	Hours: <input type="text" value="24"/> Minutes: <input type="text" value="0"/>
NTP Authentication Key Identifier	<input type="text" value="0"/>
NTP Authentication Secret Key	<input type="text"/>

3. Click **Apply**.

4.9.2 Step 9b: Configure the TLS version

This step describes how to configure the E-SBC to use TLS only. AudioCodes recommends implementing only TLS to avoid flaws in SSL.

➤ **To configure the TLS version:**

1. Open the TLS Contexts table (**Setup** menu > **IP Network** tab > **Security** folder > **TLS Contexts**).
2. In the TLS Contexts table, select the required TLS Context index row (usually default index 0 will be used), and then click '**Edit**'.
3. From the '**TLS Version**' drop-down list, select '**TLSv1.0 TLSv1.1 and TLSv1.2**'.

Figure 4-25: Configuring TLS version

GENERAL		OCSP	
Index	0	OCSP Server	Disable
Name	default	Primary OCSP Server	0.0.0
TLS Version	• TLSv1.0 TLSv1.1 and TLSv1.2	Secondary OCSP Server	0.0.0
Cipher Server	• RC4:EXP	OCSP Port	2560
Cipher Client	• ALL:!ADH	OCSP Default Response	Reject
Strict Certificate Extension Validation	Disable		

4. Click **Apply**.

4.9.3 Step 9c: Configure a Certificate

This step describes how to exchange a certificate with Microsoft Certificate Authority (CA). The certificate is used by the E-SBC to authenticate the connection with Skype for Business Server 2015.

The procedure involves the following main steps:

- a. Generating a Certificate Signing Request (CSR).
- b. Requesting Device Certificate from CA.
- c. Obtaining Trusted Root Certificate from CA.
- d. Deploying Device and Trusted Root Certificates on E-SBC.

Note: The Subject Name (CN) field parameter should be identically configured in the DNS Active Directory and Topology Builder (see Section 3.1 on page 13).

➤ **To configure a certificate:**

1. Open the TLS Contexts page (**Setup** menu > **IP Network** tab > **Security** folder > **TLS Contexts**).
2. In the TLS Contexts page, select the required TLS Context index row, and then click the **Change Certificate** link located below the table; the Context Certificates page appears.
 - a. In the 'Subject Name [CN]' field, enter the E-SBC FQDN name (e.g., **ITSP.S4B.interop**).
 - b. Fill in the rest of the request fields according to your security provider's instructions.
 - c. Click the **Create CSR** button; a textual certificate signing request is displayed in the area below the button:

Figure 4-26: Certificate Signing Request – Creating CSR

After creating the CSR, copy the text below (including the BEGIN/END lines) and send it to your Certification Authority for signing.

```
-----BEGIN CERTIFICATE REQUEST-----
MIIBwjcBxAlBADAbMRkwFwYDVQQDBB3VFNQL1M0Qj5pbnR1cm9wMIGfMA0GCSqG
S1b3DQEBAQUAA4GNADCBiQKBgQCzEs8XTnY8be/t77eEDG7rTg747GQ30DfOC4Rs

-----END CERTIFICATE REQUEST-----
```

3. Copy the CSR from the line "----BEGIN CERTIFICATE" to "END CERTIFICATE REQUEST----" to a text file (such as Notepad), and then save it to a folder on your computer with the file name, certreq.txt.
4. Open a Web browser and navigate to the Microsoft Certificates Services Web site at <http://<certificate server>/CertSrv>.

Figure 4-27: Microsoft Certificate Services Web Page

5. Click **Request a certificate**.

Figure 4-28: Request a Certificate Page

The screenshot shows a web browser window for Microsoft Certificate Services. The title bar says "Microsoft Certificate Services -- Demolab". Below it, a green header bar has "Home" on the right. The main content area has a teal header "Request a Certificate". It contains the text "Select the certificate type:" followed by two links: "Web Browser Certificate" and "E-Mail Protection Certificate". Below these, it says "Or, submit an [advanced certificate request](#)".

6. Click **advanced certificate request**, and then click **Next**.

Figure 4-29: Advanced Certificate Request Page

The screenshot shows a web browser window for Microsoft Certificate Services. The title bar says "Microsoft Certificate Services -- Demolab". Below it, a green header bar has "Home" on the right. The main content area has a teal header "Advanced Certificate Request". It contains the text "The policy of the CA determines the types of certificates you can request. Click one of the following options to:" followed by three links: "Create and submit a request to this CA", "Submit a certificate request by using a base-64-encoded CMC or PKCS #10 file, or submit a renewal request by using a base-64-encoded", and "PKCS #7 file".

7. Click **Submit a certificate request ...**, and then click **Next**.

Figure 4-30: Submit a Certificate Request or Renewal Request Page

Microsoft Active Directory Certificate Services -- Lync-DC-LYNC-CA

Submit a Certificate Request or Renewal Request

To submit a saved request to the CA, paste a base-64-encoded CMC or PKCS #10 certificate request or PKCS #7 renewal request generated by an external source (such as a Web server) in the Saved Request box.

Saved Request:

```
x8jxeP85ymyfbknfx+zEusB6z8h4JgzbeNxuyKk1
Base-64-encoded certificate request: rr4oootnsPOC4wEJAAkAAMAOGCSqGSIb3DQEBAU
(MMC or PKCS #10 or PKCS #7):
```

Certificate Template: Web Server

Additional Attributes:

Attributes:

Submit >

8. Open the certreq.txt file that you created and saved in Step , and then copy its contents to the 'Saved Request' field.
9. From the 'Certificate Template' drop-down list, select **Web Server**.
10. Click **Submit**.

Figure 4-31: Certificate Issued Page

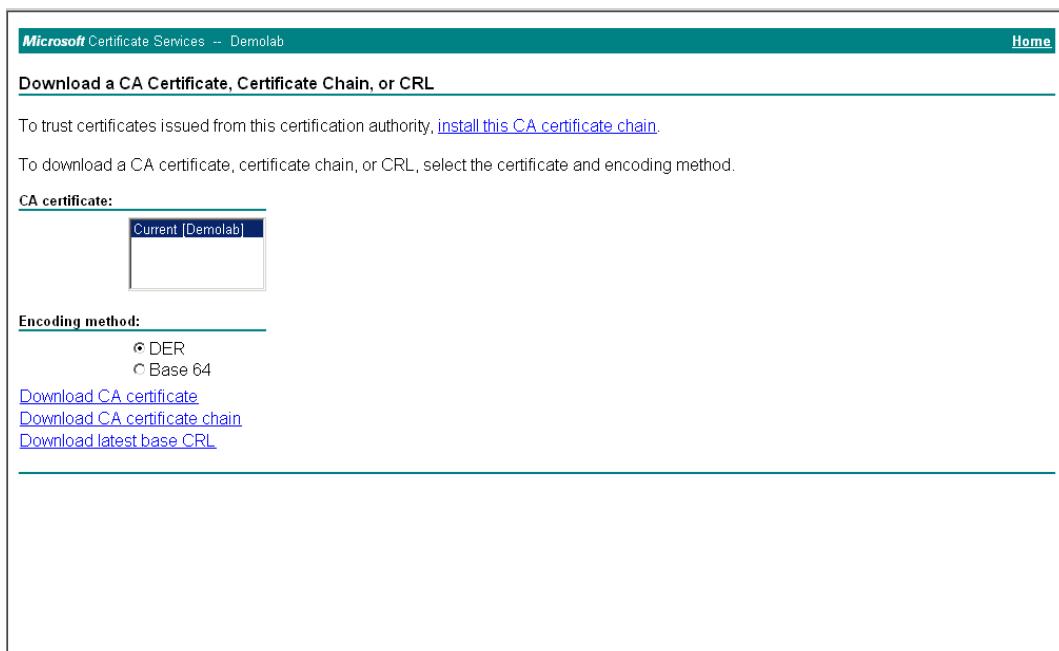

Certificate Issued

The certificate you requested was issued to you.

DER encoded or Base 64 encoded

[Download certificate](#) [Download certificate chain](#)

11. Select the **Base 64 encoded** option for encoding, and then click **Download certificate**.
12. Save the file as *gateway.cer* to a folder on your computer.
13. Click the **Home** button or navigate to the certificate server at <http://<Certificate Server>/CertSrv>.
14. Click **Download a CA certificate, certificate chain, or CRL**.

Figure 4-32: Download a CA Certificate, Certificate Chain, or CRL Page

15. Under the 'Encoding method' group, select the **Base 64** option for encoding.
16. Click **Download CA certificate**.
17. Save the file as *certroot.cer* to a folder on your computer.

- 18.** In the E-SBC's Web interface, return to the **TLS Contexts** page and do the following:
- In the TLS Contexts page, select the required TLS Context index row, and then click the **Change Certificate** link located below the table; the Context Certificates page appears.
 - Scroll down to the **Upload certificates files from your computer group**, click the **Browse** button corresponding to the '**Send Device Certificate...**' field, navigate to the *gateway.cer* certificate file that you saved on your computer in Step 12, and then click **Send File** to upload the certificate to the E-SBC.

Figure 4-33: Upload Device Certificate Files from your Computer Group

UPLOAD CERTIFICATE FILES FROM YOUR COMPUTER

Private key pass-phrase (*optional*)

Send **Private Key** file from your computer to the device.
The file must be in either PEM or PFX (PKCS#12) format.

No file selected.

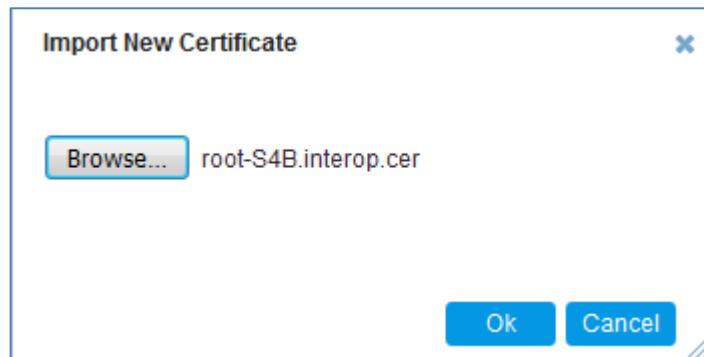

Note: Replacing the private key is not recommended but if it's done, it should be over a physically-secure network link.

Send **Device Certificate** file from your computer to the device.
The file must be in textual PEM format.

No file selected. ←

- 19.** In the E-SBC's Web interface, return to the **TLS Contexts** page.
- In the TLS Contexts page, select the required TLS Context index row, and then click the **Trusted Root Certificates** link, located at the bottom of the TLS Contexts page; the Trusted Certificates page appears.
 - Click the **Import** button, and then select the certificate file to load.

Figure 4-34: Importing Root Certificate into Trusted Certificates Store

- 20.** Click **OK**; the certificate is loaded to the device and listed in the Trusted Certificates store.
- 21.** Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.16 on page 102).

4.10 Step 10: Configure SRTP

This step describes how to configure media security. If you configure the Microsoft Mediation Server to use SRTP, you need to configure the E-SBC to operate in the same manner. Note that SRTP was enabled for Skype for Business Server 2015 when you configured an IP Profile for Skype for Business Server 2015 (see Section 4.6 on page 46).

➤ **To configure media security:**

1. Open the Media Security page (**Setup menu > Signaling & Media tab > Media folder > Media Security**).

Figure 4-35: Configuring SRTP

GENERAL		AUTHENTICATION & ENCRYPTION	
Media Security	→ • Enable	Authentication On Transmitted RTP Packets	Active
Media Security Behavior	Preferable	Encryption On Transmitted RTP Packets	Active
Offered SRTP Cipher Suites	All	Encryption On Transmitted RTCP Packets	Active
Aria Protocol Support	Disable	SRTP Tunneling Authentication for RTP	Disable
		SRTP Tunneling Authentication for RTCP	Disable
MASTER KEY IDENTIFIER		GATEWAY SETTINGS	
Master Key Identifier (MKI) Size	0	Enable Rekey After 181	Disable
Symmetric MKI	Disable		

2. From the 'Media Security' drop-down list, select **Enable** to enable SRTP.
3. Click **Apply**.
4. Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.16 on page 102).

4.11 Step 11: Configure Maximum IP Media Channels

This step describes how to configure the maximum number of required IP media channels. The number of media channels represents the number of DSP channels that the E-SBC allocates to call sessions.

Note: This step is required **only** if transcoding is required.

- **To configure the maximum number of IP media channels:**
1. Open the Media Settings page (**Setup** menu > **Signaling & Media** tab > **Media** folder > **Media Settings**).

Figure 4-36: Configuring Number of Media Channels

The screenshot shows the 'Media Settings' configuration page. Under the 'GENERAL' tab, there are several settings: 'NAT Traversal' (Disable NAT), 'Enable Continuity Tones' (Disable), 'Inbound Media Latch Mode' (Dynamic), 'Number of Media Channels' (set to 100, highlighted with a blue lightning bolt icon), 'Enforce Media Order' (Disable), and 'SDP Session Owner' (AudiocodesGW). A blue lightning bolt icon also points to the 'Number of Media Channels' field.

2. In the 'Number of Media Channels' field, enter the number of media channels according to your environments transcoding calls (e.g., **100**).
3. Click **Apply**.
4. Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.16 on page 102).

4.12 Step 12: Configure IP-to-IP Call Routing Rules

This step describes how to configure IP-to-IP call routing rules. These rules define the routes for forwarding SIP messages (e.g., INVITE) received from one IP entity to another. The E-SBC selects the rule whose configured input characteristics (e.g., IP Group) match those of the incoming SIP message. If the input characteristics do not match the first rule in the table, they are compared to the second rule, and so on, until a matching rule is located. If no rule is matched, the message is rejected. The routing rules use the configured IP Groups (as configured in Section 4.8 on page 45,) to denote the source and destination of the call.

For the interoperability test topology, the following IP-to-IP routing rules need to be configured to route calls between Skype for Business Server 2015 (LAN) and Swisscom SIP Trunk (DMZ):

- Terminate SIP OPTIONS messages on the E-SBC that are received from the both LAN and DMZ
- Terminate REFER messages to Skype for Business Server 2015
- Calls from Skype for Business Server 2015 to Swisscom SIP Trunk
- Calls from Swisscom SIP Trunk to Fax supporting ATA device (if required)
- Calls from Swisscom SIP Trunk to Skype for Business Server 2015
- Calls from Fax supporting ATA device to Swisscom SIP Trunk (if required)

➤ **To configure IP-to-IP routing rules:**

1. Open the IP-to-IP Routing table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Routing > IP-to-IP Routing**).
2. Configure a rule to terminate SIP OPTIONS messages received from the both LAN and DMZ:
 - a. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	0
Name	OPTIONS Termination (arbitrary descriptive name)
Source IP Group	Any
Request Type	OPTIONS
Destination Type	Dest Address
Destination Address	internal

Figure 4-37: Configuring IP-to-IP Routing Rule for Terminating SIP OPTIONS

The screenshot shows the 'IP-to-IP Routing [OPTIONS termination]' configuration dialog. At the top, it displays the 'Routing Policy' as '#0 [Default_SBCRoutingPolicy]'. The dialog is divided into several sections: 'GENERAL', 'MATCH', and 'ACTION'. In the 'GENERAL' section, 'Index' is set to 0 and 'Name' is set to 'OPTIONS termination'. In the 'MATCH' section, 'Source IP Group' is set to 'Any' and 'Request Type' is set to 'OPTIONS'. In the 'ACTION' section, 'Destination Type' is set to 'Dest Address' and 'Destination Address' is set to 'internal'. Other fields like 'Destination IP Group', 'Destination SIP Interface', 'Destination Port', etc., are also visible.

- b. Click **Apply**.

3. Configure a rule to terminate REFER messages to Skype for Business Server 2015:
- Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	1
Route Name	S4B Refer (arbitrary descriptive name)
Source IP Group	Any
Call Trigger	REFER
ReRoute IP Group	S4B
Destination Type	Request URI
Destination IP Group	S4B
Destination SIP Interface	S4B

Figure 4-38: Configuring IP-to-IP Routing Rule for Terminating REFER

The screenshot shows the 'IP-to-IP Routing' configuration page. At the top, there's a header bar with the title 'IP-to-IP Routing' and a tab labeled '[S4B Refer]'. Below the header, there's a dropdown menu for 'Routing Policy' set to '#0 [Default_SBCRoutingPolicy]'. The main area is divided into several sections: 'GENERAL', 'ACTION', 'MATCH', and 'OPTIONS'. In the 'GENERAL' section, 'Index' is set to 1 and 'Name' is set to 'S4B Refer'. In the 'ACTION' section, 'Destination Type' is set to 'Request URI'. In the 'MATCH' section, 'Source IP Group' is set to 'Any'. At the bottom right, there are 'Cancel' and 'APPLY' buttons.

- Click **Apply**.

4. Configure a rule to route calls from Skype for Business Server 2015 to Swisscom SIP Trunk:

- a. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	2
Route Name	S4B to ITSP (arbitrary descriptive name)
Source IP Group	S4B
Destination Type	IP Group
Destination IP Group	Swisscom
Destination SIP Interface	Swisscom

Figure 4-39: Configuring IP-to-IP Routing Rule for S4B to ITSP

The screenshot shows the 'IP-to-IP Routing' configuration page. At the top, it displays the 'Routing Policy' as '#0 [Default_SBCRoutingPolicy]'. Below this, the 'S4B to ITSP' rule is selected. The interface is divided into several sections: 'GENERAL' (Index: 2, Name: S4B to ITSP, Alternative Route Options: Route Row), 'ACTION' (Destination Type: IP Group, Destination IP Group: #1 [Swisscom], Destination SIP Interface: #1 [Swisscom]), 'MATCH' (Source IP Group: #0 [S4B], Request Type: All, Source Username Prefix: *, Source Host: *, Source TAN:), and 'OPTIONS' (Destination Address, Destination Port, Destination Transport Type, IP Group Set, Call Setup Rules Set ID, Group Policy: Sequential, Cost Group). At the bottom, there are 'Cancel' and 'APPLY' buttons.

- b. Click **Apply**.

5. Configure rule to route calls from Swisscom SIP Trunk to Fax supporting ATA device:
- Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	3
Route Name	ITSP to Fax (arbitrary descriptive name)
Source IP Group	Swisscom
Destination Username Prefix	+41438198709 (dedicated FAX number)
Destination Type	IP Group
Destination IP Group	Fax
Destination SIP Interface	S4B

Figure 4-40: Configuring IP-to-IP Routing Rule for ITSP to Fax

The screenshot shows the 'IP-to-IP Routing' configuration page. At the top, there is a dropdown for 'Routing Policy' set to '#0 [Default_SBCRoutingPolicy]'. The main area is divided into 'GENERAL' and 'ACTION' tabs.

GENERAL Tab:

- Index: 3
- Name: ITSP to Fax
- Alternative Route Options: Route Row

ACTION Tab:

- Destination Type: IP Group
- Destination IP Group: #2 [Fax]
- Destination SIP Interface: #0 [S4B]
- Destination Address: (empty)
- Destination Port: 0
- Destination Transport Type: (empty)
- IP Group Set: --
- Call Setup Rules Set ID: -1
- Group Policy: Sequential
- Cost Group: --

MATCH Tab:

- Source IP Group: #1 [Swisscom]
- Request Type: All
- Source Username Prefix: *
- Source Host: *
- Source Tari: (empty)

At the bottom, there are 'Cancel' and 'APPLY' buttons.

- Click **Apply**.

6. Configure rule to route calls from Swisscom SIP Trunk to Skype for Business Server 2015:

- Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	4
Route Name	ITSP to S4B (arbitrary descriptive name)
Source IP Group	Swisscom
Destination Type	IP Group
Destination IP Group	S4B
Destination SIP Interface	S4B

Figure 4-41: Configuring IP-to-IP Routing Rule for ITSP to S4B

The screenshot shows the 'IP-to-IP Routing' configuration page. At the top, it displays the 'Routing Policy' as '#0 [Default_SBCRoutingPolicy]'. Below this, there are two main sections: 'GENERAL' and 'ACTION'. In the 'GENERAL' section, the 'Index' is set to 4, the 'Name' is 'ITSP to S4B', and the 'Alternative Route Options' is set to 'Route Row'. In the 'ACTION' section, the 'Destination Type' is 'IP Group', 'Destination IP Group' is '#0 [S4B]', and 'Destination SIP Interface' is '#0 [S4B]'. Under the 'MATCH' tab, the 'Source IP Group' is '#1 [Swisscom]', 'Request Type' is 'All', 'Source Username Prefix' is '*', 'Source Host' is '*', and 'Source TAN' is empty. The 'ACTION' tab also includes fields for 'Destination Address', 'Destination Port', 'Destination Transport Type', 'IP Group Set', 'Call Setup Rules Set ID', 'Group Policy', and 'Cost Group'. At the bottom of the form are 'Cancel' and 'APPLY' buttons.

- Click **Apply**.

7. Configure a rule to route calls from Fax supporting ATA device to Swisscom SIP Trunk:
- Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	5
Route Name	Fax to ITSP (arbitrary descriptive name)
Source IP Group	Fax
Destination Type	IP Group
Destination IP Group	Swisscom
Destination SIP Interface	Swisscom

Figure 4-42: Configuring IP-to-IP Routing Rule for Fax to ITSP

The screenshot shows the Audiocodes configuration interface for 'IP-to-IP Routing'. The top navigation bar has tabs for 'IP-to-IP Routing' and 'Fax to ITSP'. A dropdown menu shows 'Routing Policy #0 [Default_SBCRoutingPolicy]'. The main area is divided into 'GENERAL' and 'ACTION' sections. In the GENERAL section, 'Index' is set to 5 and 'Name' is set to 'Fax to ITSP'. Under 'Alternative Route Options', 'Route Row' is selected. In the ACTION section, 'Destination Type' is set to 'IP Group', 'Destination IP Group' is set to '#1 [Swisscom]', and 'Destination SIP Interface' is set to '#1 [Swisscom]'. Below these sections is a 'MATCH' section containing various filters like 'Source IP Group' (#2 [Fax]), 'Request Type' (All), and 'Source Host' (*). At the bottom are 'Cancel' and 'APPLY' buttons.

- Click **Apply**.

The configured routing rules are shown in the figure below:

Figure 4-43: Configured IP-to-IP Routing Rules in IP-to-IP Routing Table

IP-to-IP Routing (6)											
+ New Edit Insert ↑ ↓ Delete Page <input type="text" value="1"/> of 1 << >> <<1 >>1 Show <input type="text" value="10"/> records per page <input type="text"/> Search											
INDEX	NAME	ROUTING POLICY	ALTERNATIVE ROUTE OPTIONS	SOURCE IP GROUP	REQUEST TYPE	SOURCE USERNAME PREFIX	DESTINATION USERNAME PREFIX	DESTINATION TYPE	DESTINATION IP GROUP	DESTINATION SIP INTERFACE	DESTINATION ADDRESS
0	OPTIONS ter	Default_SBC1	Route Row	Any	OPTIONS	*	*	Dest Address	internal
1	S4B Refer	Default_SBC1	Route Row	Any	All	*	*	Request URI	S4B	S4B	
2	S4B to ITSP	Default_SBC1	Route Row	S4B	All	*	*	IP Group	Swisscom	Swisscom	
3	ITSP to Fax	Default_SBC1	Route Row	Swisscom	All	*	+4143819871	IP Group	Fax	S4B	
4	ITSP to S4B	Default_SBC1	Route Row	Swisscom	All	*	*	IP Group	S4B	S4B	
5	Fax to ITSP	Default_SBC1	Route Row	Fax	All	*	*	IP Group	Swisscom	Swisscom	

Note: The routing configuration may change according to your specific deployment topology.

4.13 Step 13: Configure IP-to-IP Manipulation Rules

This step describes how to configure IP-to-IP manipulation rules. These rules manipulate the SIP Request-URI user part (source or destination number). The manipulation rules use the configured IP Groups (as configured in Section 4.8 on page 45) to denote the source and destination of the call.

Note: Adapt the manipulation table according to your environment dial plan.

For example, for this interoperability test topology, a manipulation is configured to add the "+" (plus sign) to the destination number for calls from the Fax ATA device IP Group to the Swisscom SIP Trunk IP Group for any destination username prefix; and introduce anonymous call when dialing "*31" prefix from any IP Group to the Swisscom SIP Trunk IP Group.

➤ **To configure a number manipulation rule:**

1. Open the Outbound Manipulations table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Manipulation** > **Outbound Manipulations**).
2. Click **New**, and then configure the parameters as follows:

Parameter	Value
Index	0
Name	For Anonymous Calls
Source IP Group	Any
Destination IP Group	Swisscom
Destination Username Prefix	*31
Manipulated Item	Source URI
Privacy Restriction Mode	Restrict

Figure 4-44: Configuring IP-to-IP Outbound Manipulation Rule

3. Click Apply.

The figure below shows an example of configured IP-to-IP outbound manipulation rules for calls between Skype for Business Server 2015 IP Group and Swisscom SIP Trunk IP Group:

Figure 4-45: Example of Configured IP-to-IP Outbound Manipulation Rules

Outbound Manipulations (3)													
INDEX	NAME	ROUTING POLICY	ADDITIONAL MANIPULATION	SOURCE IP GROUP	DESTINATION IP GROUP	SOURCE USERNAME PREFIX	DESTINATION USERNAME PREFIX	MANIPULATED ITEM	REMOVE FROM LEFT	REMOVE FROM RIGHT	LEAVE FROM RIGHT	PREFIX TO ADD	SUFFIX TO ADD
0	For Anonymous Calls	Default_SBC	No	Any	Swisscom	*	*31	Source URI	0	0	255		
1	For Anonymous Calls	Default_SBC	No	Any	Swisscom	*	*31	Destination	3	0	255	+	
2	For outgoing calls	Default_SBC	No	Fax	Any	*	*	Destination	0	0	255	+	

Rule Index	Description
0	Calls from Any IP Group to ITSP IP Group with the prefix destination number "***31", apply restriction policy on the source number.
1	Calls from Any IP Group to ITSP IP Group with the prefix destination number "***31", remove 3 digits (*31) from this prefix.
2	Calls from Fax IP Group to ITSP IP Group with any destination number (*), add "+" to the prefix of the destination number.

4.14 Step 14: Configure Message Manipulation Rules

This step describes how to configure SIP message manipulation rules. SIP message manipulation rules can include insertion, removal, and/or modification of SIP headers. Manipulation rules are grouped into Manipulation Sets, enabling you to apply multiple rules to the same SIP message (IP entity).

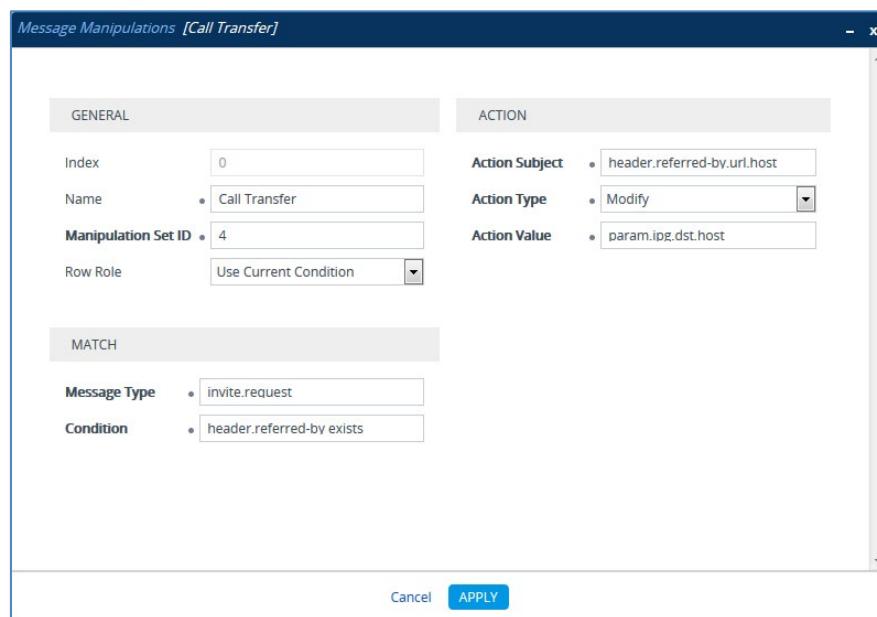

Once you have configured the SIP message manipulation rules, you need to assign them to the relevant IP Group (in the IP Group table) and determine whether they must be applied to inbound or outbound messages.

➤ **To configure SIP message manipulation rule:**

1. Open the Message Manipulations page (**Setup** menu > **Signaling & Media** tab > **Message Manipulation** folder > **Message Manipulations**).
2. Configure a new manipulation rule (Manipulation Set 4) for Swisscom the SIP Trunk. This rule applies to messages sent to the Swisscom SIP Trunk IP Group in a Call Transfer scenario. This rule replaces the host part of the SIP Referred-By header with the value taken from the 'Group Name' field of the Swisscom SIP Trunk IP Group.

Parameter	Value
Index	0
Name	Call Transfer
Manipulation Set ID	4
Message Type	invite.request
Condition	header.referred-by exists
Action Subject	header.referred-by.url.host
Action Type	Modify
Action Value	param.ipg.dst.host

Figure 4-46: Configuring SIP Message Manipulation Rule 0 (for Swisscom SIP Trunk)

3. If the manipulation rule Index 0 (above) is executed, then the following rule is also executed. It adds the SIP Diversion header with values from the SIP Referred-by header.

Parameter	Value
Index	1
Name	Call Transfer
Manipulation Set ID	4
Row Role	Use Previous Condition
Message Type	
Condition	
Action Subject	header.diversion
Action Type	Add
Action Value	header.referred-by

Figure 4-47: Configuring SIP Message Manipulation Rule 1 (for Swisscom SIP Trunk)

GENERAL		ACTION	
Index	1	Action Subject	header.diversion
Name	Call Transfer	Action Type	Add
Manipulation Set ID	4	Action Value	header.referred-by
Row Role	Use Previous Condition		
MATCH			
Message Type			
Condition			
		Cancel	APPLY

4. If the manipulation rule Index 1 (above) is executed, then the following rule is also executed. It removes the SIP Referred-by header.

Parameter	Value
Index	2
Name	Call Transfer
Manipulation Set ID	4
Row Role	Use Previous Condition
Message Type	
Condition	
Action Subject	header.referred-by
Action Type	Remove
Action Value

Message Manipulations [Call Transfer]

GENERAL	ACTION
Index Name Manipulation Set ID Row Role	Action Subject Action Type Action Value
MATCH	
Message Type Condition	

Cancel **APPLY**

5. Configure another manipulation rule (Manipulation Set 4) for the Swisscom SIP Trunk. This rule applies to messages sent to the Swisscom SIP Trunk IP Group. This rule replaces the host part of the SIP Diversion header with the value that was configured in the Swisscom SIP Trunk IP Group as Group Name.

Parameter	Value
Index	3
Name	Change Diversion Host
Manipulation Set ID	4
Message Type	invite.request
Condition	header.diversion exists
Action Subject	header.diversion.url.host
Action Type	Modify
Action Value	param.ipg.dst.host

Figure 4-49: Configuring SIP Message Manipulation Rule 3 (for Swisscom SIP Trunk)

Message Manipulations [Change Diversion Host]

The screenshot shows the 'Message Manipulations' configuration window for rule 3. It has three main sections: GENERAL, ACTION, and MATCH.

- GENERAL:**
 - Index: 3
 - Name: Change Diversion Host
 - Manipulation Set ID: 4
 - Row Role: Use Current Condition
- ACTION:**
 - Action Subject: header.diversion.url.host
 - Action Type: Modify
 - Action Value: param.ipg.dst.host
- MATCH:**
 - Message Type: invite.request
 - Condition: header.diversion exists

At the bottom right are 'Cancel' and 'APPLY' buttons.

6. Configure another manipulation rule (Manipulation Set 4) for Swisscom SIP Trunk. This rule is applied to response messages sent to the Swisscom SIP Trunk IP Group. Swisscom SIP Trunk send two media streams in the SIP INVITE message – m=audio (for audio stream) and m=image (for T.38 fax stream). In the response message, when only audio call is answered, AudioCodes SBC send ‘m=image 0’ and ‘a=inactive’ in order to clarify that T.38 fax will not be used. But the Swisscom SIP Trunk requests to remove ‘a=inactive’ and leave only ‘m=image 0’.

Parameter	Value
Index	4
Name	Remove ‘a=inactive’
Manipulation Set ID	4
Message Type	any.response
Condition	body.sdp regex (.*)(m=image 0)(.*)(a=inactive)(.*)
Action Subject	body.sdp
Action Type	Modify
Action Value	\$1+\$2+\$3+\$5

Figure 4-50: Configuring SIP Message Manipulation Rule 4 (for Swisscom SIP Trunk)

Message Manipulations [Remove 'a=inactive']

GENERAL		ACTION	
Index	4	Action Subject	body.sdp
Name	Remove 'a=inactive'	Action Type	Modify
Manipulation Set ID	4	Action Value	\$1+\$2+\$3+\$5
Row Role	Use Current Condition		
MATCH			
Message Type	any.response		
Condition	body.sdp regex (.*)(m=image 0)(.*)(a=inactive)(*)		
<input type="button" value="Cancel"/> <input type="button" value="APPLY"/>			

7. Configure another manipulation rule (Manipulation Set 4) for Swisscom SIP Trunk. This rule is applied to response messages sent to the Swisscom SIP Trunk IP Group for Call Forward of Anonymous Call initiated by the Skype for Business Server 2015 IP Group. This removes the user=phone variable from the SIP 'From' header.

Parameter	Value
Index	5
Name	For Forward Anonymous
Manipulation Set ID	4
Message Type	any.request
Condition	header.from.url contains 'anonymous'
Action Subject	header.from.url.userphone
Action Type	Remove
Action Value

Message Type	any.request		
Condition	header.from.url contains 'anonymous'		

Cancel **APPLY**

8. Configure another manipulation rule (Manipulation Set 4) for Swisscom SIP Trunk. This rule is applied to response messages sent to the Swisscom SIP Trunk IP Group for Call Forward of Anonymous Call initiated by the Skype for Business Server 2015 IP Group. This adds the SIP Privacy header with a value of 'id'.

Parameter	Value
Index	6
Name	For Forward Anonymous
Manipulation Set ID	4
Message Type	any.request
Condition	header.from.url contains 'anonymous'
Action Subject	header.privacy
Action Type	Add
Action Value	'id'

- 11.** Configure another manipulation rule (Manipulation Set 4) for Swisscom SIP Trunk. This rule is applied to 200 OK response messages sent to the Swisscom SIP Trunk IP Group. This adds a SIP Require header with a value of 'timer', if the SIP Session Expire header exists.

Parameter	Value
Index	10
Name	Add Require=timer
Manipulation Set ID	4
Message Type	any.response.200
Condition	header.session-expire exists
Action Subject	header.require
Action Type	Add
Action Value	'timer'

Figure 4-55: Configuring SIP Message Manipulation Rule 10 (for Swisscom SIP Trunk)

The screenshot shows the 'Message Manipulations' configuration window for rule index 10. The title bar indicates the rule is for 'Add Require=timer'. The window is divided into three main sections: GENERAL, ACTION, and MATCH.

- GENERAL:**
 - Index: 10
 - Name: Add Require=timer
 - Manipulation Set ID: 4
 - Row Role: Use Current Condition
- ACTION:**
 - Action Subject: header.require
 - Action Type: Add
 - Action Value: 'timer'
- MATCH:**
 - Message Type: any.response.200
 - Condition: header.session-expire exists

At the bottom right are 'Cancel' and 'APPLY' buttons.

12. Configure another manipulation rule (Manipulation Set 4) for Swisscom SIP Trunk. This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule removes the Display Name.

Parameter	Value
Index	11
Name	Remove DisplayName
Manipulation Set ID	4
Message Type	Invite
Action Subject	Header.From.QuoteDisplayName
Action Type	Remove

Message Type	any
Condition	

Cancel **APPLY**

- 15.** Configure another manipulation rule (Manipulation Set 4) for Swisscom SIP Trunk. This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule replaces the host part of the 'SIP To' header with the Destination IP address.

Parameter	Value
Index	14
Name	To ITSP change To Host to Dest. IP
Manipulation Set ID	4
Message Type	any
Condition	
Action Subject	header.to.url.host
Action Type	Modify
Action Value	param.message.address.dst.address

Figure 4-59: Configuring SIP Message Manipulation Rule 14 (for Swisscom SIP Trunk)

The screenshot shows the 'Message Manipulations' configuration window for rule 14. The title bar indicates the rule is named '[To ITSP change To Host to Dest. IP]'. The window is divided into three main sections: GENERAL, ACTION, and MATCH.

- GENERAL:** Contains fields for Index (14), Name (To ITSP change To Host to Dest. IP), Manipulation Set ID (4), and Row Role (Use Current Condition).
- ACTION:** Contains fields for Action Subject (header.to.url.host), Action Type (Modify), and Action Value (param.message.address.dst.address).
- MATCH:** Contains fields for Message Type (any) and Condition (empty).

At the bottom right are 'Cancel' and 'APPLY' buttons.

16. Configure another manipulation rule (Manipulation Set 4) for Swisscom SIP Trunk. This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This replaces the host part of the SIP 'From' header with the value from the SIP Contact header.

Parameter	Value
Index	15
Name	To ITSP change From Host to local IP
Manipulation Set ID	4
Message Type	any
Condition	
Action Subject	header.from.url.host
Action Type	Modify
Action Value	header.contact.url.host

- 19.** Configure another manipulation rule (Manipulation Set 10) for Swisscom SIP Trunk. This rule is applied to OPTIONS messages sent to the Swisscom SIP Trunk IP Group. This replaces the host part of the SIP Request-URI header with the Destination IP address.

Parameter	Value
Index	18
Name	OPTIONS Manipulation
Manipulation Set ID	10
Message Type	OPTIONS
Condition	
Action Subject	header.request-uri.url.host
Action Type	Modify
Action Value	param.message.address.dst.address

Figure 4-63: Configuring SIP Message Manipulation Rule 18 (for Swisscom SIP Trunk)

The screenshot shows the 'Message Manipulations' configuration dialog for rule 18. The title bar reads 'Message Manipulations [OPTIONS Manipulation]'. The dialog is divided into several sections:

- GENERAL** tab: Contains fields for Index (18), Name (OPTIONS Manipulation), Manipulation Set ID (10), and Row Role (Use Current Condition).
- ACTION** tab: Contains fields for Action Subject (header.request-uri.url.host), Action Type (Modify), and Action Value (param.message.address.dst.address).
- MATCH** tab: Contains fields for Message Type (Options) and Condition.
- Buttons at the bottom: Cancel and APPLY.

20. Configure another manipulation rule (Manipulation Set 10) for Swisscom SIP Trunk. This rule is applied to OPTIONS messages sent to the Swisscom SIP Trunk IP Group. This replaces the host part of the 'SIP To' header with the Destination IP address.

Parameter	Value
Index	19
Name	OPTIONS Manipulation
Manipulation Set ID	10
Message Type	OPTIONS
Condition	
Action Subject	header.to.url.host
Action Type	Modify
Action Value	param.message.address.dst.address

6	For Forward Anor	4	any.request	header.from.url c	header.privacy	Add	'id'	Use Current Condition
7	For Forward Anor	4			header.p-asserted-id	Modify	header.diversion	Use Previous Condition
8	For Forward Anor	4			header.from.url.r	Modify	'anonymous.invalid'	Use Previous Condition

The table displayed below includes SIP message manipulation rules which are grouped together under Manipulation Set ID 4 and which are executed for messages sent to and from the Swisscom SIP Trunk IP Group as well as the Skype for Business Server 2015 IP Group. These rules are specifically required to enable proper interworking between Swisscom SIP Trunk and Skype for Business Server 2015. Refer to the *User's Manual* for further details concerning the full capabilities of header manipulation.

Rule Index	Rule Description	Reason for Introducing Rule
0	This rule applies to messages sent to the Swisscom SIP Trunk IP Group in a Call Transfer scenario. This rule replaces the host part of the SIP Referred-By header with the value taken from the 'Group Name' field of the Swisscom SIP Trunk IP Group.	For Call Transfer scenarios, Swisscom SIP Trunk request SIP Diversion header instead of SIP Referred-By header, sent from the Skype for Business.
1	If manipulation rule index above is executed, then the following rule is also executed. It adds the SIP Diversion header with values from the SIP Referred-by header.	
2	If manipulation rule index above is executed, then the following rule is also executed. It removes the SIP Referred-by header.	
3	This rule applies to messages sent to the Swisscom SIP Trunk IP Group. This rule replaces the host part of the SIP Diversion header with the value that was configured in the Swisscom SIP Trunk IP Group as Group Name.	Swisscom SIP Trunk request that Host part of SIP Diversion header will be pre-configured.
4	This rule is applied to response messages sent to the Swisscom SIP Trunk IP Group. It removes 'a=inactive' from responses sent to the Swisscom SIP Trunk.	Swisscom The SIP Trunk sends two media streams in the SIP INVITE message – m=audio (for audio stream) and m=image (for T.38 fax stream). In the response message, when only the audio call is answered, the AudioCodes SBC sends 'm=image 0' and 'a=inactive' to clarify that T.38 fax will not be used. But the Swisscom SIP Trunk requests to remove 'a=inactive' and leave only 'm=image 0'.

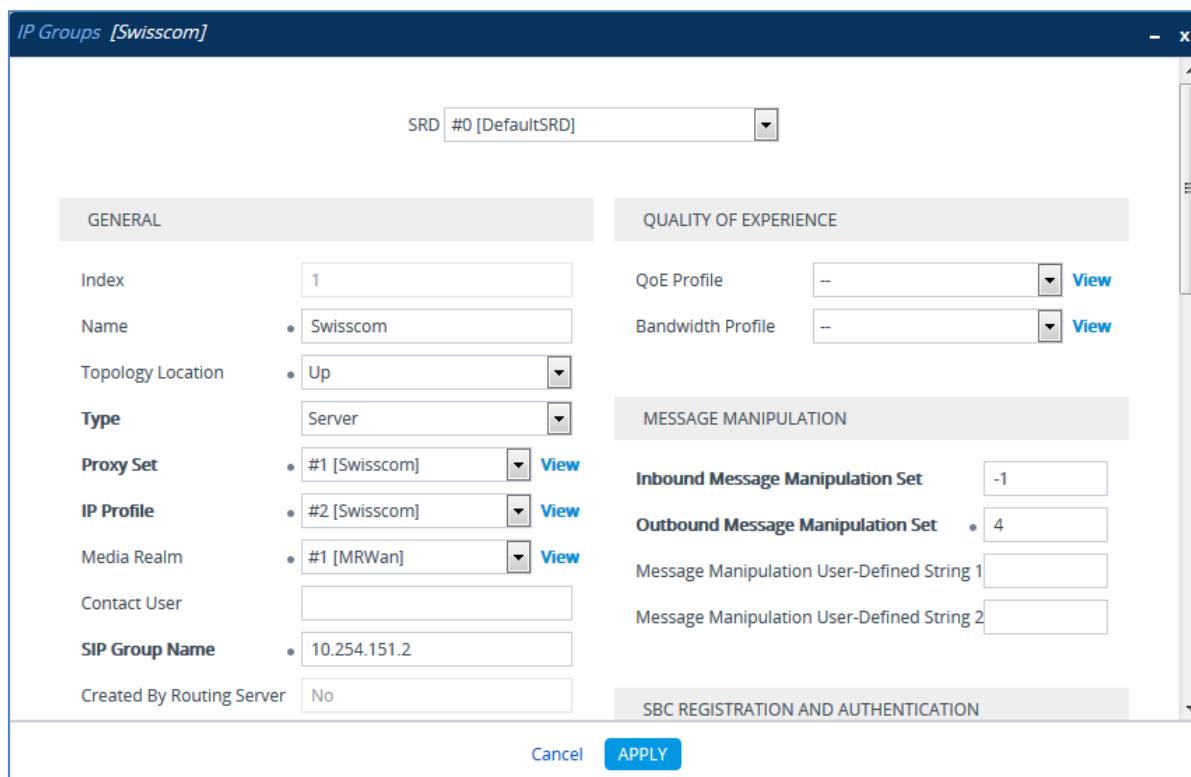

Rule Index	Rule Description	Reason for Introducing Rule
5	This rule is applied to response messages sent to the Swisscom SIP Trunk IP Group for Call Forward of Anonymous Call initiated by the Skype for Business Server 2015 IP Group. This removes the user=phone variable from the SIP 'From' header.	
6	This rule is applied to response messages sent to the Swisscom SIP Trunk IP Group for Call Forward of Anonymous Call initiated by the Skype for Business Server 2015 IP Group. This adds the SIP Privacy header with value 'id'.	These rules are applied to normalize messages for Call Forward of an Anonymous Call initiated by Skype for Business Server 2015.
7	If the manipulation rule index above is executed, then the following rule is also executed. This rule replaces the user part of the SIP P-Asserted-Identity header with the value from the SIP Diversion header.	
8	If the manipulation rule index above is executed, then the following rule is also executed. This rule replaces the host part of the SIP 'From' header with the value 'anonymous.invalid'.	
10	This rule is applied to 200 OK response messages sent to the Swisscom SIP Trunk IP Group. This adds the SIP Require header with a value of 'timer' if the SIP Session Expire header exists.	
11	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule removes the Display name.	
12	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule normalizes the SDP body of each message.	
13	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule replaces the host part of the SIP Request-URI header with the Destination IP address.	
14	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule replaces the host part of the SIP 'To' header with destination IP address.	
15	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This rule replaces the host part of the SIP 'From' header with the value from the SIP Contact header.	
16	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This replace the host part of the SIP P-Asserted-Identity header with the value from the SIP Contact header.	
17	This rule is applied to all messages sent to the Swisscom SIP Trunk IP Group. This remove 'ms-opaque' parameter from the SIP Contact header.	

Rule Index	Rule Description	Reason for Introducing Rule
18	This rule is applied to OPTIONS messages sent to the Swisscom SIP Trunk IP Group. This replace the host part of the SIP Request-URI header with destination IP address.	These rules are needed to ensure that the SIP OPTIONS requests are send to the correct IP address.
19	This rule is applied to OPTIONS messages sent to the Swisscom SIP Trunk IP Group. This replace the host part of the SIP 'To' header with destination IP address.	

21. Assign Manipulation Set ID 4 to the Swisscom SIP trunk IP Group:

- Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
- Select the row of the Swisscom SIP trunk IP Group, and then click **Edit**.
- Set the 'Outbound Message Manipulation Set' field to 4.

Figure 4-66: Assigning Manipulation Set 4 to the Swisscom SIP Trunk IP Group

22. Click **Apply**.

4.15 Step 15: Miscellaneous Configuration

This section describes miscellaneous E-SBC configuration.

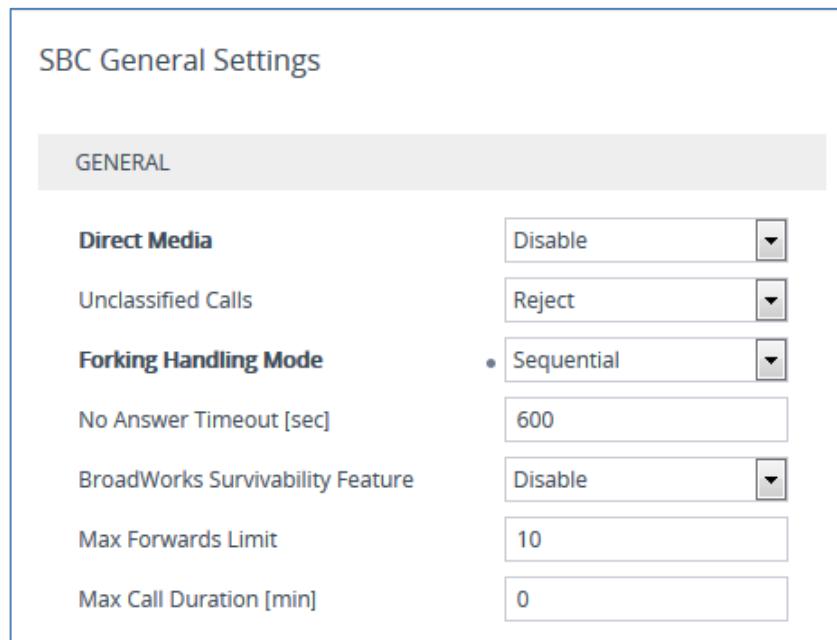

4.15.1 Step 15a: Configure Call Forking Mode

This step describes how to configure the E-SBC's handling of SIP 18x responses received for call forking of INVITE messages. For the interoperability test topology, if a SIP 18x response with SDP is received, the E-SBC opens a voice stream according to the received SDP. The E-SBC re-opens the stream according to subsequently received 18x responses with SDP or plays a ringback tone if a 180 response without SDP is received. It is mandatory to set this field for the Skype for Business Server 2015 environment.

➤ **To configure call forking:**

1. Open the SBC General Settings page (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **SBC General Settings**).
2. From the 'SBC Forking Handling Mode' drop-down list, select **Sequential**.

Figure 4-67: Configuring Forking Mode

3. Click **Apply**.

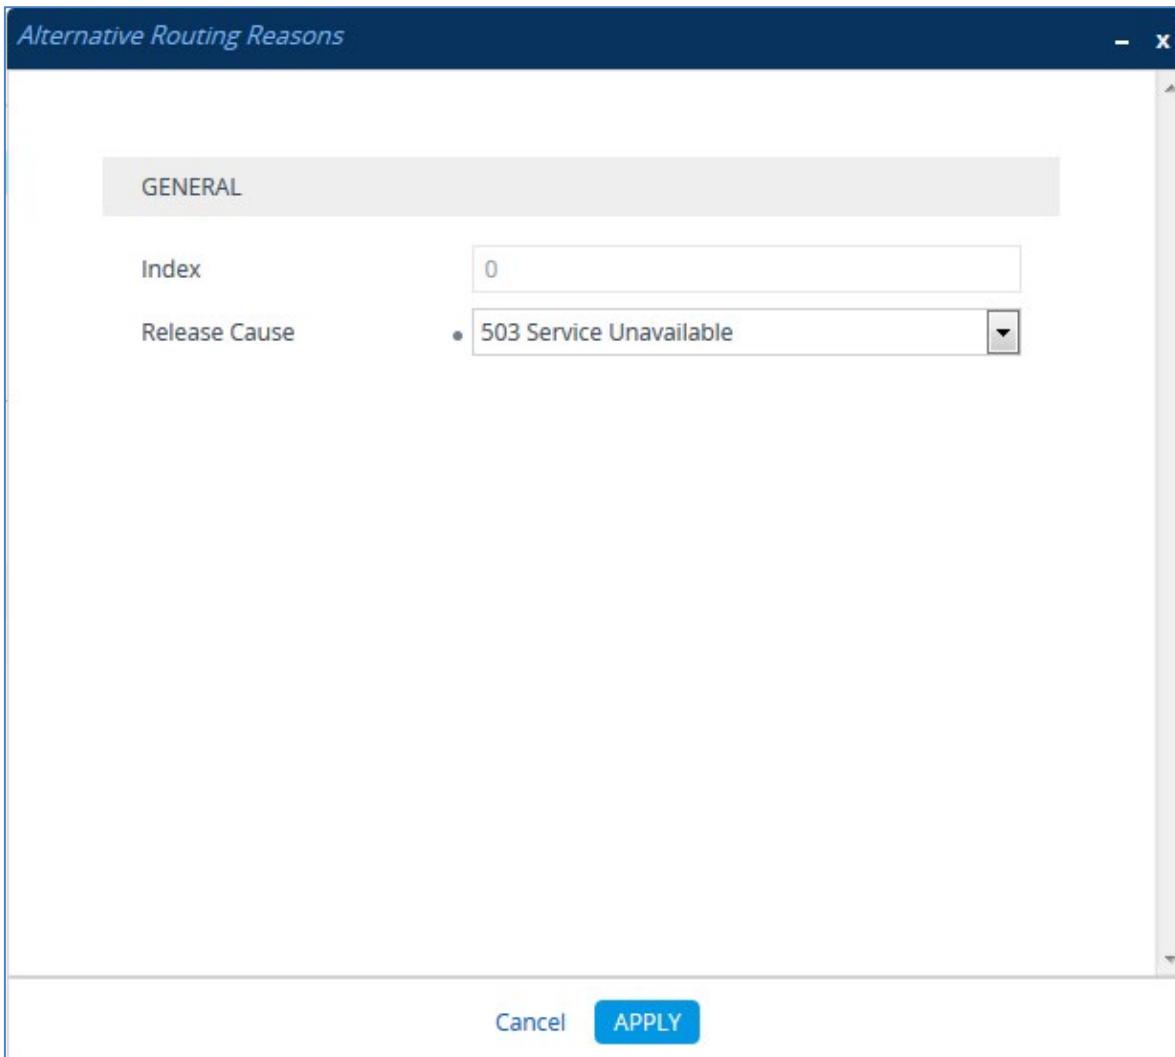

4.15.2 Step 15b: Configure SBC Alternative Routing Reasons

This step describes how to configure the E-SBC's handling of SIP 503 responses received for outgoing SIP dialog-initiating methods, e.g., INVITE, OPTIONS, and SUBSCRIBE messages. In this case E-SBC attempts to locate an alternative route for the call.

➤ **To configure SIP reason codes for alternative IP routing:**

1. Open the Alternative Routing Reasons table (**Setup menu > Signaling & Media tab > SBC folder > Routing > Alternative Reasons**).
2. Click **New**.
3. From the 'Release Cause' drop-down list, select **503 Service Unavailable**.

Figure 4-68: SBC Alternative Routing Reasons Table

4. Click **Apply**.

4.15.3 Step 15c: Configure User-Agent Information

This step describes how to configure the AudioCodes E-SBC's universal user agent value.

➤ **To configure User Agent:**

1. Open the SBC SIP Definitions page (**Setup** menu > **Signaling & Media** tab > **SIP Definitions** folder > **Message Structure**).
2. In the 'User-Agent Information' field, enter **AudioCodes-Mediant** value.

Figure 4-69: User-Agent Information

User-Agent Information

•

3. Click **Apply**.

4.15.4 Step 15d: Configuration Needed for Manipulating SIP OPTIONS

This step describes how to configure the E-SBC's string name in SIP OPTIONS Keep-alive messages (host part of the Request-URI).

➤ **To configure the string name for SIP OPTIONS:**

1. Open the Proxy & Registration page (**Setup** menu > **Signaling & Media** tab > **SIP Definitions** folder > **Proxy & Registration**).
2. In the 'Gateway Name' field, enter the name according to the ITSP requirement (e.g., **10.254.151.2**).
3. From the 'Use Gateway Name for OPTIONS' drop-down list, select **Yes**.

Figure 4-70: Configuring String Name for SIP OPTIONS

Gateway Name	• <input type="text" value="10.254.151.2"/>
Use Gateway Name for OPTIONS	• <input type="button" value="Yes"/>

4. Click **Apply**.

➤ **To configure the Gateway Outbound Manipulation Set:**

1. Open the Admin page.
2. Append the case-sensitive suffix 'AdminPage' to the device's IP address in your Web browser's URL field (e.g., <http://10.15.17.10/AdminPage>).
3. In the left pane of the page that opens, click **ini Parameters**.

Figure 4-71: Configuring GW Outbound Manipulation Set via AdminPage

Output Window

```
Parameter Name: GWOUTBOUNDMANIPULATIONSET
Parameter New Value: 10
Parameter Description:Outbound manipulation set ID for GW - If configured,
applies for all outgoing INVITE requests.
```

4. Enter these values in the 'Parameter Name' and 'Enter Value' fields:

Parameter	Value
GWOUTBOUNDMANIPULATIONSET	10

5. Click the **Apply New Value** button for each field.
6. Click on **Back to Main**. On the main page don't forget to save the configuration.

4.15.5 Step 15e: Configure Max Forward Limits

This step describes how to configure the E-SBC's Max Forward Limits.

➤ **To configure the Max Forward Limits:**

1. Open the SBC General Settings page (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **SBC General Settings**).
2. In the 'Max Forwards Limit' field, enter the value according to the ITSP requirement (e.g., **70**).

Figure 4-72: Configuring Max Forward Limits

The screenshot shows the 'SBC General Settings' configuration page. The 'GENERAL' tab is selected. Under the 'GENERAL' tab, there are several settings listed with their current values:

- Direct Media: Disable
- Unclassified Calls: Reject
- Forking Handling Mode: Sequential
- No Answer Timeout [sec]: 600
- BroadWorks Survivability Feature: Disable
- Max Forwards Limit: 70 (This is the setting being configured)
- Max Call Duration [min]: 0

3. Click **Apply**.

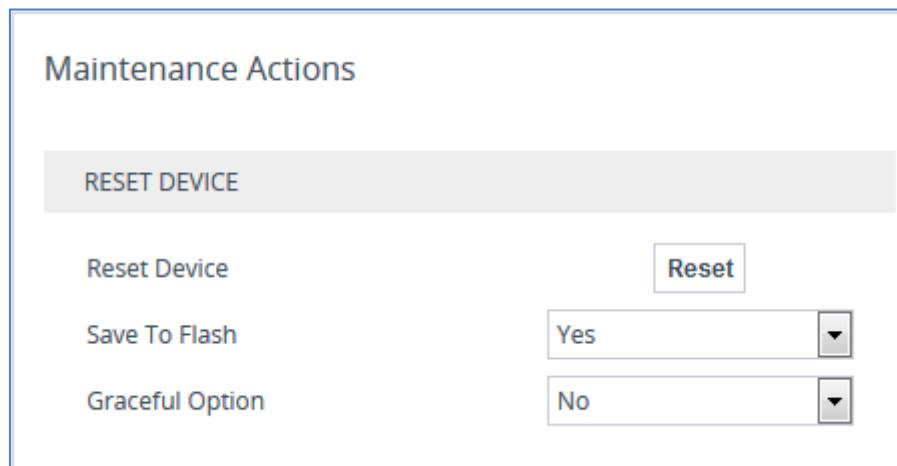

4.16 Step 16: Reset the E-SBC

After you have completed the configuration of the E-SBC described in this chapter, save ("burn") the configuration to the E-SBC's flash memory with a reset for the settings to take effect.

➤ **To reset the device through Web interface:**

1. Open the Maintenance Actions page (**Setup** menu > **Administration** tab > **Maintenance** folder > **Maintenance Actions**).

Figure 4-73: Resetting the E-SBC

2. Ensure that the 'Save To Flash' field is set to **Yes** (default).
3. Click the **Reset** button; a confirmation message box appears, requesting you to confirm.
4. Click **OK** to confirm device reset.

A AudioCodes INI File

The *ini* configuration file of the E-SBC, corresponding to the Web-based configuration as described in Section 4 on page 31, is shown below:

Note: To load or save an *ini* file, use the Configuration File page (**Setup** menu > **Administration** tab > **Maintenance** folder > **Configuration File**).

B Configuring Analog Devices (ATAs) for Fax Support

This section describes how to configure the analog device entity to route its calls to the AudioCodes Media Gateway for supporting faxes. The analog device entity must be configured to send all calls to the AudioCodes SBC.

Note: The configuration described in this section is for ATA devices configured for AudioCodes MP-11x series.

B.1 Step 1: Configure the Endpoint Phone Number Table

The 'Endpoint Phone Number Table' page allows you to activate the MP-11x ports (endpoints) by defining telephone numbers. The configuration below uses the example of ATA destination phone number "+41438198709" (IP address 10.15.77.12) with all routing directed to the SBC device (10.15.77.77).

- **To configure the Endpoint Phone Number table:**
- Open the Endpoint Phone Number Table page (**Configuration tab > VoIP menu > GW and IP to IP submenu > Hunt Group sub-menu > Endpoint Phone Number**).

Figure B-1: Endpoint Phone Number Table Page

Endpoint Phone Number Table				
	Channel(s)	Phone Number	Hunt Group ID	Tel Profile ID
1	1	+41438198709		0
2				
3				
4				

B.2 Step 2: Configure Tel to IP Routing Table

This step describes how to configure the Tel-to-IP routing rules to ensure that the MP-11x device sends all calls to the AudioCodes central E-SBC device.

- **To configure the Tel to IP Routing table:**
- Open the Tel to IP Routing page (**Configuration tab > VoIP menu > GW and IP to IP sub-menu > Routing sub-menu > Tel to IP Routing**).

Figure B-2: Tel to IP Routing Page

The screenshot shows the 'Tel to IP Routing' configuration page. At the top, there are dropdown menus for 'Routing Index' (set to 1-10) and 'Tel To IP Routing Mode' (set to 'Route calls before manipulation'). Below this is a table with two rows of data:

Src. Hunt Group ID	Dest. Phone Prefix	Source Phone Prefix	->	Dest. IP Address	Port	Transport Type	Dest. IP Group ID	IP Profile ID	Cost Group ID
1	*	*	->	10.15.77.77	5060	UDP	-1	0	None
2			->			Not Configured	-1		None

B.3 Step 3: Configure Coders Table

This step describes how to configure the coders for the MP-11x device.

- **To configure MP-11x coders:**
- Open the Coders page (**Configuration tab > VoIP menu > Coders And Profiles sub-menu > Coders**).

Figure B-3: Coders Table Page

The screenshot shows the 'Coders Table' configuration page. Below the table header, there is a note: 'Coder Name' is required, 'Packetization Time' and 'Rate' are optional, and 'Payload Type' and 'Silence Suppression' are disabled by default. The table contains three rows of data:

Coder Name	Packetization Time	Rate	Payload Type	Silence Suppression
G.711A-law	20	64	8	Disabled
G.711U-law	20	64	0	Disabled

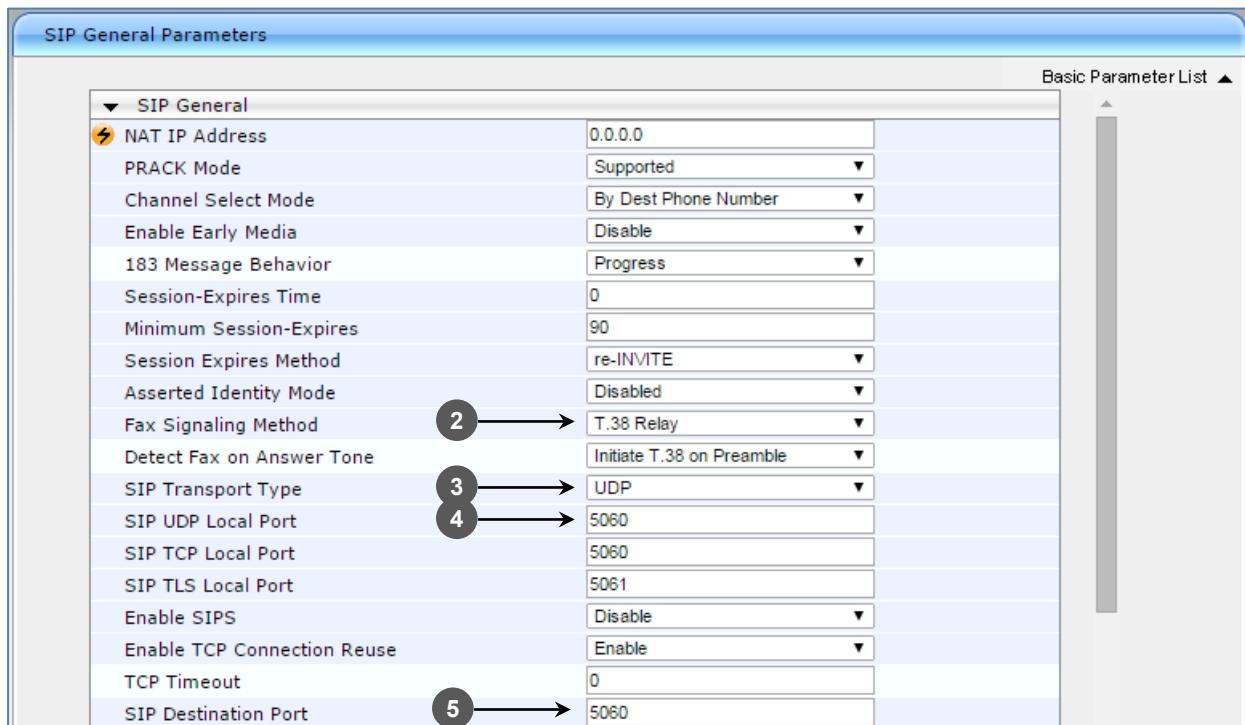

B.4 Step 4: Configure SIP UDP Transport Type and Fax Signaling Method

This step describes how to configure the fax signaling method for the MP-11x device.

➤ **To configure the fax signaling method:**

1. Open the SIP General Parameters page (**Configuration** tab > **VoIP** menu > **SIP Definitions** submenu > **General Parameters**).

Figure B-4: SIP General Parameters Page

2. From the 'FAX Signaling Method' drop-down list, select **G.711 Transport** for G.711 fax support and select **T.38 Relay** for T.38 fax support.
3. From the 'SIP Transport Type' drop-down list, select **UDP**.
4. In the 'SIP UDP Local Port' field, enter **5060** (corresponding to the Central Gateway UDP transmitting port configuration).
5. In the 'SIP Destination Port', enter **5060** (corresponding to the Central Gateway UDP listening port configuration).
