1 Overview

This document shows how to use the AudioCodes Routing Manager (ARM). The ARM is a LINUX-based, software-only, telephony management product which expedites and streamlines IP telephony routing for enterprises with multiple globally distributed branches. The ARM determines the quickest, least expensive, and best call quality routes in packet networks.

Routing data, previously located on the SBC, Unified Communications (UC) application (e.g., Microsoft's Skype for Business), or Media Gateway, is now located on the ARM server. If an enterprise has an SBC in every branch, a single ARM, deployed in HQ, can route all calls in the globally distributed corporate network to PSTN, the local provider, enterprise headquarters, or to the IP network. Routing rules, configured by the IT manager in the ARM's Routing Table, perform the routing.

If an enterprise has only one or two branches, its IT manager can easily independently implement maintenance changes. In globally distributed enterprises, IT managers until now had to laboriously implement changes, multiple times, per branch. With the ARM, IT managers implement changes only once, saving significant labor and time resources and costs.

The following figure shows a typical, globally-distributed, multi-branch enterprise VoIP network.

VoIP networks like this typically require:

Distributed routing & policy enforcement

- Distributed PSTN
- Multiple VoIP network entities' configurations (i.e., SBC, Media Gateway)
- Multiple Dial Plans
- SIP Interworking between IP PBXs
- Large number of end user policies
- Efficient ARM routing management

Features

ARM features are as follows:

- Centralized, enterprise-wide session routing management
- Fully integrated into AudioCodes' One Voice Operations Center (OVOC) management system (ARM Version 8.4 and later and OVOC Version 7.6 and later)
- Centralized & optimized PSTN routing
- Automatic discovery of VoIP network entities
- Supports third-party devices as well as AudioCodes SBCs and gateways
- Smart Dial Plan management
 - Centralized Dial Plan logic; simple, clear, intuitive and easy to maintain
 - Dialing plan dry test by 'Test Route' simulation; animated path for Test Route
 - Incoming number manipulation
 - Outgoing number manipulation
 - User properties manipulation
- Reduces SIP trunk costs
 - Implements Tail-End-Hop-Off Routing
 - Assigns actions to routing rules with different sequence
 - Source and destination number manipulation
- Advanced routing based on user properties
- Quality-based routing
- Time-based routing
- Flexible load balancing
- Automatic topology network generation
- Manual network generation (simply drawing lines between dots)
- On-the-fly routing calculation:
 - Centralized management of Network Routing Rules

Routing decision is based on source / destination call parameters, and user properties

- Predefined weights on connections
- User information from external databases, e.g., LDAP and RADIUS; operator login authentication with these servers
- Flexible API
- Intuitive graphical representation of the enterprise VoIP network
- Support for very large networks (topology elements) with high numbers of edges (Connections and Peer Connections)
 - Multiple topology elements can be moved / repositioned simultaneously
 - Lightweight hoover for each topology element
 - Easily accessible Actions on each topology element
- Personalized Call Routing Applications
 - Communication-Enabled Business Process
 - Full on-line management and routing via REST API
 - Fallback to SBC routing table if call does not match ARM configuration

Benefits

The ARM benefits users as follows:

- Reduces operational time spent on designing and provisioning network topology
- Reduces OPEX, avoiding routing configuration of VoIP network entities
- Reduces time spent implementing network evolutions such as:
 - Adding new connections to PSTN (e.g., SIP trunks)
 - Adding new branches to the enterprise VoIP network
 - Modifying user voice services privileges

Simplicity

- VoIP network entities registering in the ARM
- Auto-discovery of VoIP peers
- One-click topology network creation, star formation
- Customized topology network
 - Configuring a connection is as simple as drawing a line
 - Modify by adding, deleting and changing connections
- ARM connects to user data base

ARM-Routed Devices

The following devices can be routed by the ARM:

- Mediant 9000 SBC
- Mediant 4000 SBC
- Mediant 2600 SBC
- Mediant SE/VE SBC
- Mediant 1000B Gateway and E-SBC
- Mediant 800B Gateway and E-SBC
- Mediant 800C
- Mediant 500 E-SBC
- Mediant 500L SBC
- Mediant SBC CE (Cloud Edition)
- Mediant 3000 Gateway only

Third-Party Open-Source Software

The following third-party open-source software is supported by the ARM:

- Apache Commons Apache License 2.0
- JSON.simple by google apache license 2.0
- json-path apache license 2.0
- ben-manes/caffeine apache license 2.0
- TinyRadius GNU LESSER GENERAL PUBLIC LICENSE
- MongoDB Server Side Public License (SSPL)
- mongodb-driver Apache License, Version 2.0
- CentOS Linux 6.9
- Spring Framework (released under version 2.0)
- MariaDB relational database management system
- ActiveMQ (using the Apache 2.0 license)
- HiberNate (projects licensed under Lesser General Public License (LGPL) v2.1)
- Log4J (Apache License 2.0)
- Guava (Google core libraries Apache License 2.0)
- Jackson The Apache Software License, Version 2.0
- Apache Commons Logging™
- HttpClient Apache
- XStream (Group: com.thoughtworks.xstream)
- Jersey client
- Joda-Time
- SLF4J (Simple Logging Facade for Java)
- HikariCP Java 6
- Aspectj™ extension to Java
- SNMP4J (Open Source SNMP API for Java)
- Mockito
- tomcat-coyote The Apache License, Version 2.0
- Angular 1.6.6

2 Getting Started with the ARM

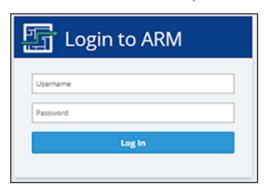

After installing the ARM and performing initial configuration (see the ARM Installation Manual), you can get started managing routing with the ARM.

Logging in

Logging in is a prerequisite to getting started with the ARM.

➤ To log in:

1. Point your web browser to the ARM's IP address and press Enter.

2. In the Login to ARM screen, log in using the default **Operator** and **Operator** username and password. It's advisable to change these as soon as possible (see Provisioning Operators on page 106 for instructions on how to change them).

The ARM opens in the Network page, Map view (default) in your browser. By default, all VoIP entities managed in the network are displayed.

Getting Acquainted with the ARM GUI

The ARM's internet browser based graphic user interface visualizes VoIP network topology and its components, providing centralized, dynamic network management and router rules and logic management. After logging in, the Network page, Map view opens by default.

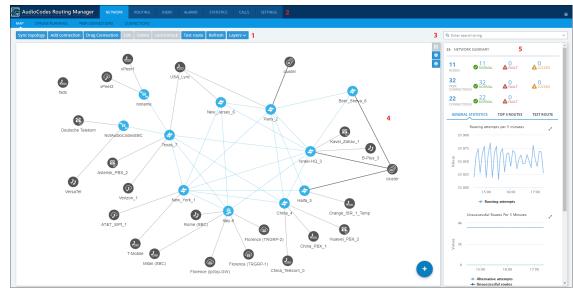

Figure 2-1: ARM GUI - Network Page - Map View

Use the following legend as a reference to the preceding figure.

GUI Area Description 1 Actions Sync Topology Bar Add Connection **Drag Connection** Edit Delete Lock/Unlock **Test Route** Refresh Layers topology quality 2 Toolbar Toolbar icons let you navigate to the following ARM pages: NETWORK, ROUTING, USERS, ALARMS, STATISTICS and SETTINGS.

Table 2-1: ARM GUI - Map View

#	GUI Area	Description			
		Located in the uppermost right corner of the page on the toolbar. b			
		 View the name of the operator currently logged in and their security / permission level Save logs (GUI logs) 			
		Lock (Terminates user's ARM GUI session)			
		■ Log out			
		Display the ARM version (About)			
		Save Configuration: The ARM_Configuration.zip file (ARM database) is saved locally in the client's 'Downloads' directory. You can send it to AudioCodes for troubleshooting. In parallel, basic ARM backup is performed and the backup file is stored in the configurator's /home/backup directory. You can use it to restore the configuration on the same machine using standard ARM restore procedure.			
		Display how much time remains before the session terminates			
3		Save items collapse state and location (saves entities' positions in the Network Map after they're moved).			
3	•	Diagrams Configurations (opens the Map Settings pop-up menu):			
		MAP SETTINGS			
		Hide edges on drag Animate path drawing Limit labels length			
		Apply			
		For more information about Hide edges on drag , see Repositioning			

#	GUI Area	Description			
		Elements in the Network Map Page on page 40 Select Animate path drawing for animated visualizations of Test Route and Top Route actions.			
		Select Limit labels length to limit the lengths of the labels of the displayed Nodes and VoIP Peers to a predefined number of characters, useful with large networks and long Node and / or VoIP Peer names which clutter the Network Map. If selected, the parameter 'Max label length' is displayed in which the maximum number of characters allowed is defined.			
3		Center Map (centers the Network Map in the middle of the page)			
3	Search	Enables you to locate specific information in the Network Map view, Routing page, Users page, Alarms page and Settings page. 1. Click ^ adjacent to 'Enter search string'. Q Enter search string Name Administrative State Operative State Elements (choose at least one) Search Cancel 2. Define search parameters: Name and/or Administrative State and/or Operative State. At least one item must be selected. 3. You can also search for a Node by the Node's IP address, not only by the Node's name, which is an essential functionality in very large deployments with high numbers of Nodes.			
4	Main Screen	The Network page displays a Map view of network entities.			
5	Summary Panes	The Network page, Map view, displays these summary panes: Network Summary Nodes (Available, Unavailable, Locked)			

#	GUI Area	Description		
		✔ Peer Connections (Available, Unavailable, Locked)		
		✓ Connections (Available, Unavailable)		
		■ General Statistics		
		✓ Routing Attempts per 5 Minutes		
		✓ Unsuccessful Routes per 5 Minutes		
		 Unsuccessful Routes (Alternative Attempts / Destinations Not Routable) 		
		✓ Calls per 5 Minutes (Destination Calls / Transient Calls)		
		■ Top 5 Routes (with animation)		
		■ Test Route		

Getting Acquainted with the Network Map Topology Layer

In the Network page, Map view, you can view node information and perform network map actions. Network Map view shows the four main entities that comprise the network topology:

- Nodes
- VolP Peers
- Peer Connections
- Connections

The following table explains each.

Table 2-2: Network Map view – Network Entities

		Network Map view Network Entitles	
Network Entity Icon		Explanation	
Node	3 3	Indicates an AudioCodes SBC communicating with the ARM. It's part of the ARM network topology. Blue = operative state available/logging in Red = operative state unavailable/unrouteable Orange = operative state logged out Strikethrough = locked No strikethrough = unlocked	
	3 3	Indicates an AudioCodes gateway communicating with the ARM. It's part of the ARM network topology. Blue = operative state available Red = operative state unavailable INVALID CONFIGURATION Orange = operative state logged out Strikethrough = locked No strikethrough = unlocked	
	3	Indicates a hybrid AudioCodes device (AudioCodes' Gateway and SBC in one). Blue = operative state available Red = operative state unavailable INVALID CONFIGURATION Orange = operative state logged out Strikethrough = locked No strikethrough = unlocked	

Network Entity	Icon	Explanation	
	(3)	Indicates a third-party, non-AudioCodes device (SBC or gateway) communicating with the ARM. It's part of the ARM network topology.	
VoIP Peer		ARM network gateways. The calls and are c	n-AudioCodes device or entity that is also part of the topology: PBXs, SIP trunks, other vendors' SBCs / ese devices participate in processing ARM network connected to Nodes by 'Peer Connections'. The ARM configure one of six VoIP Peer types.
		P	SIP trunk
		®	PSTN
		2)	IP phones
		2	Legacy PBX IP PBX
		N/A	Not applicable
Connection	**************************************	Indicated by a blue line (available) or a red line (unavailable). Joins two Nodes. Calls can be routed between two Nodes only if there is a Connection between them. Defined by adding an IP Group (at Node level). From AudioCodes' gateway/SBC perspective, a 'Connection' is an 'IP Group'. Connections between Nodes are added by the ARM operator.	
Peer Connection		Indicated by a black line between a Node and a VoIP Peer. Represents a group of routing destinations/sources (connections to a VoIP Peer), 'last mile' connectivity. From AudioCodes' gateway/SBC perspective, a Peer Connection is a 'PSTN Trunk Group' or 'IP Group'. Red line = administrative state is unlocked / operative state is unavailable (no connection between the AudioCodes device and the remote device) / predeleted (IP Group was deleted from the device) Black line through a red sphere = unavailable and locked Black line through a black sphere = available but locked	
		Operators ca	n lock / unlock a Peer Connection as well as select a

Network Entity	Icon	Explanation
		directional based lock / unlock which allows for example stopping only traffic towards a specific VoIP Peer (for example, a specific IVR) while calls coming from this VoIP Peer will still be routed to their destination. The feature can be used to perform a graceful stoppage of traffic for maintenance reasons (for example). The feature is essential for IVR VoIP Peers when there are always calls in a queue that are not yet connected to an agent. From the IVR's perspective, the connection to the agent is outbound calls; without the uni-directional lock feature, calls fail. The Map page and Peer Connections page indicate a Peer Connection's directional lock.

Getting Acquainted with the Network Map Quality Layer

The Network Map view displays a **Layers** tab that allows the operator to choose **topology** and / or **quality**.

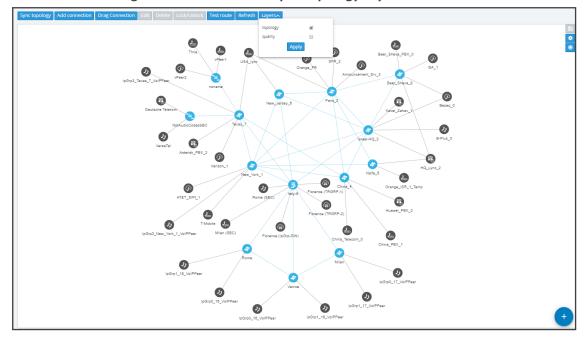

Figure 2-2: Network Map – Topology Layer

The **topology** layer displays the availability status of network entities.

The **quality** layer displays the quality status of network Connections and Peer Connections.

When both the **topology** layer and the **quality** layer are selected, the Network Map displays the aggregated availability status and quality status.

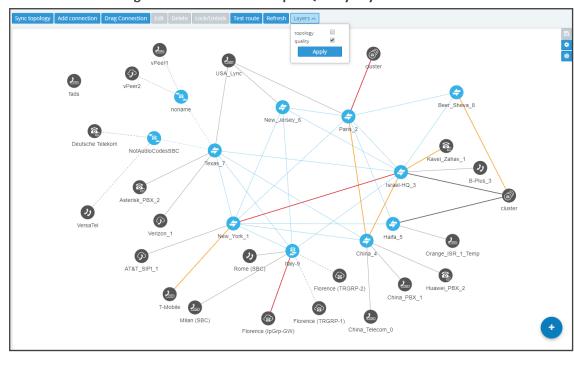

Figure 2-3: Network Map – Quality Layer

The figure above shows the Network Map when the **Quality Layer** is applied.

The following table describes the different quality color codes.

 Color
 Description

 Blue
 GOOD quality Connection

 Grey
 GOOD quality Peer Connection

 Orange
 FAIR quality Connection / Peer Connection

 Red
 BAD quality Connection / Peer Connection

 Dotted grey
 UNKNOWN quality, i.e., there is insufficient data to determine quality statistics.

 After enough calls are routed by the Connection / Peer Connection, the color changes from grey to the color of the determined quality static.

Table 2-3: Quality Color Codes

A glance at the page reveals the quality of each Connection and Peer Connection, indicated by color code.

➤ To view a summary of a Connection, including quality:

1. In the Network Map page, select **topology** layer and/or **quality** layer and then click (select) the Connection whose summary you want to view.

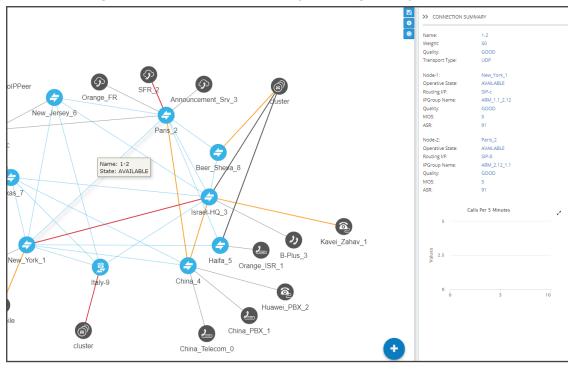

Figure 2-4: Connection Summary Including Quality

- View a summary of the connection in the Connection Summary pane on the right side of the Network Map page. The figure above shows the Connection Summary pane for the Connection between the node Paris_2 and New_York_1. The 'Quality' parameter for both nodes is 'GOOD'.
- 3. Use each direction's MOS and ASR values to tune the threshold for quality-based routing [Settings > Routing > Quality Based Routing] and optimize network quality.

> To view a summary of a Peer Connection, including quality:

1. In the Network Map page, select **topology** layer and/or **quality** layer and then click (select) the Peer Connection whose summary you want to view.

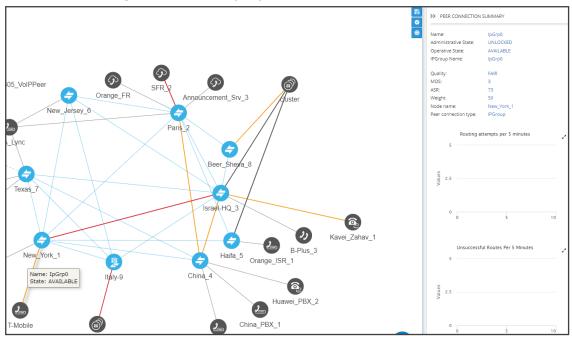

Figure 2-5: Quality Layer - Peer Connection

- 2. In the Peer Connection Summary pane on the right side of the Network Map page, view the Peer Connection Summary for the Peer Connection you clicked (selected). The figure above shows the Peer Connection whose name is 'IpGrp0'. The 'Quality' parameter is 'FAIR'.
- 3. Use each direction's MOS and ASR values to tune the threshold for quality-based routing [Settings > Routing > Quality Based Routing] and optimize network quality.

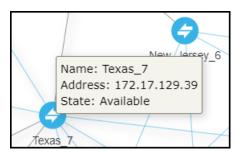

Getting Acquainted with Network Map Page Actions

Node Information and Actions

In the Network page, Map view, you can view node information and perform node actions.

> To view node information:

1. Point your cursor over the node whose information you want to view.

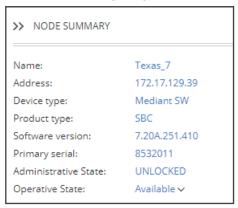

2. Use the following table as reference.

Table 2-4: Node Information

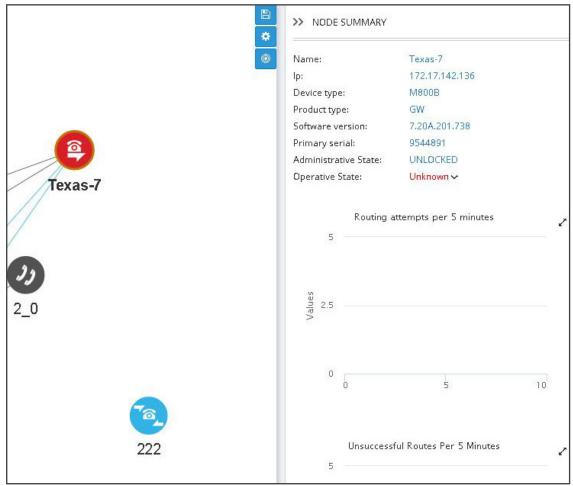

Item	Description		
Name	The name of the Node		
Address	The IP address of the Node		
State	Available / Unavailable / Unrouteable / Logged out / Logging in. The ARM provides a robust node State Machine based on the node's connectivity to the ARM component. When determining a node's connectivity and ability to process a call in the State Machine, the ARM factors in the node's connectivity to the ARM Configurator (both ways), the node's connectivity to ARM Routers (from the node's perspective) and the node's connectivity to ARM Routers (from the ARM Routers perspective). The ARM Routers attempt to serve the node's routing requests even if the node is reported as disconnected from the ARM Configurator. In this case, the ARM Router routes calls based on last available information about the nodes' interfaces, their availability and quality. This node's 'Unknown' state is reported via ARM alarms. A node becomes Unrouteable only if all ARM Routers report that the node does not communicate with them (neither 'keep-alive' nor 'Get Route' requests). To help you localize a network issue, the Node Summary screen displays a detailed view of the node's connectivity status, as shown in the following figure.		

Figure 2-6: Node Summary – Operative State

The example below shows a node's 'Unknown' state when the ARM Configurator is unable to access the SBC 'Texas-7'. Note that in this state, call routing requests coming from this node to the ARM Routers will be served.

Figure 2-7: Node's 'Unknown' State

> To perform an action on a node:

1. Right-click the node on which to perform an action.

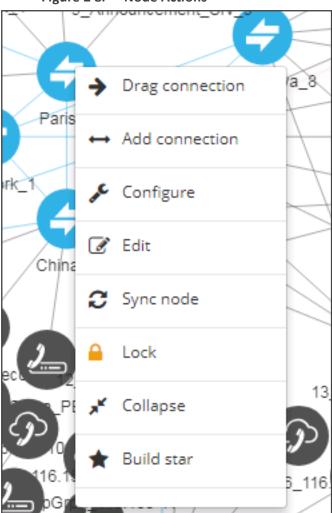

Figure 2-8: Node Actions

2. From the popup menu, choose:

a. Drag connection. Allows you to draw (drag) a connection between two nodes In the ARM Map (Paris_2 and Italy-9 in the following figure, where Paris_2 is the node you right-clicked and from where you begin dragging, and Italy-9 is the node in which you end the drag).

Name: Paris_2
Ip address: 17
State: Availabl

Paris_2

Italy-9

Co

Figure 2-9: Drag Connection

 Add Connection [also available by selecting a node and then clicking the Add Connection button]

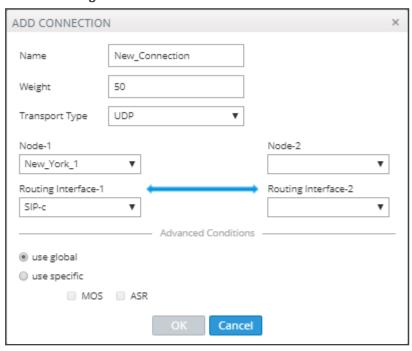

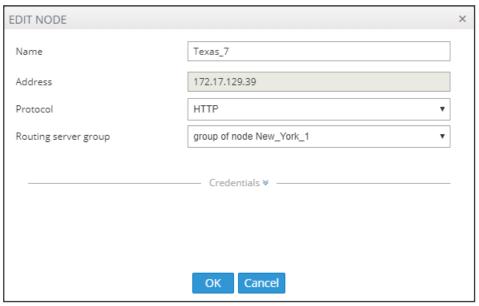

Figure 2-10: Add Connection

- Make sure the relevant SIP interface in the SBC is provisioned and configured as 'Used by routing server'
- ◆ In the Add Connection screen shown in the figure above, Node-1 will be configured (the node you initially selected). From the 'Node-2' drop-down menu, select the node to which to make the connection, and then click OK. See Adding an AudioCodes Node to the ARM on page 51 for more information.
- c. Configure. Lets you directly configure a node (or SIP module) in the node's Web interface without needing to provide the node's credentials (Single Sign-on). See the AudioCodes device's *User's Manual* for detailed information. Nodes version 7.2.150 and later are supported. Earlier node versions do not support single sign-on; you

must provide credentials before you can access their Web interface. Choose the option; the node's Web interface opens without prompting the operator for credentials.

- d. Edit [also available by selecting the node and then clicking the Edit button]
 - In the Edit Node dialog that opens see the following figure update the credentials of the device if necessary.

Figure 2-11: Edit Node

- ◆ From the 'Protocol' drop-down menu, select the protocol that the ARM Configurator (server) uses when communicating with this node. Default: HTTPS. If you don't want to encrypt the traffic – e.g., when debugging – use HTTP.
- From the 'Routing server group' drop-down, select the Routing Server Group to which you attached the node, described under Adding a Routing Server Group with Internal and External Priorities on page 158.
- e. Sync Node
- f. Lock/Unlock
- Collapse. In Network Map view, you can collapse VoIP Peers associated with a node. In large networks containing multiple VoIP Peers with each VoIP Peer connected to a node, this can significantly simplify (unclutter) the view, facilitating more effective management. To apply a collapse:
 - Select the **Collapse** action from the menu that pops up after right-clicking the node; all VoIP Peers associated with the node collapse.

133.155-13 >> CLUSTER SUMMARY ۰ Name: cluster Number of voip peers: 7 VolP Peers GW-100-14 Name: 58_lpGrp0_GW1-14 cluster SIP_TRUNK Type: Name: 1-TRGRP-1-14 Type: PSTN 2-TRGRP-2-14 Name: 7 peer connections PBX Type:

Figure 2-12: Collapsed VoIP Peers

- [Refer to the preceding figure] The cluster's label in the Network Map as well as the Cluster Summary indicate the number of collapsed VoIP Peers / Peer Connections in the cluster.
- [Refer to the figure following] The Cluster Summary can also indicate the aggregated number of collapsed VoIP Peers / Peer Connections in a cluster.

Figure 2-13: Peer Connection Aggregation Summary: Number of Peer Connections

◆ Add to cluster. You can add an additional VoIP Peer or multiple VoIP Peers to an existing cluster: (1) Select the target cluster to which to add (2) press the Ctrl key click one or multiple VoIP Peers to add to the target cluster (3) right-click and from the pop-up menu select the action Add to cluster.

14-TR

Add to cluster

1-TRGF

cluster

Figure 2-14: Add to cluster

VoIP Peers associated with more than one node are included in the collapsed cluster. If a test route is performed that terminates on a collapsed VoIP Peer, the VoIP Peer will not be expanded automatically and the path displayed in the GUI will terminate on the cluster icon.

Designations

| Secretary | Se

Figure 2-15: Test Route Path Terminates on Collapsed VoIP Peer

h. After collapsing VoIP Peers, you can expand them again by right-clicking the cluster icon and then choosing the **Expand** action from the popup menu.

3 peer connections

Expand

Clu

Edit

Figure 2-16: Expand Cluster of VoIP Peers

- i. Delete. Only available if the Node has been Locked and no routing rules and Policy Studio rules are associated with it. If routing rules are associated with the Node or its Peer Connections and you want to delete it, update or delete the rule so it does not refer to the topology entity which is going to be deleted.
- j. Build Star (Topology)

VoIP Peer Information and Actions

In the Network page, Map view, you can view VoIP Peer information and perform VoIP Peer actions. There are six types of VoIP Peers:

- SIP Trunk
- PBX
- IP PBX
- PSTN
- IP Phone
- N/A (default)

> To view VoIP Peer information:

1. Point your cursor over the VoIP Peer whose information you want to view.

Figure 2-17: SIP Trunk

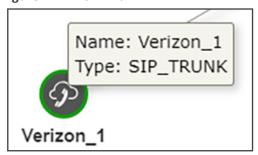

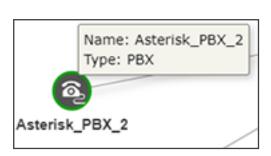

Figure 2-18: PBX | IP PBX

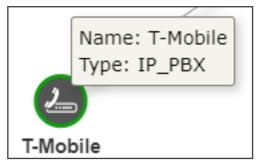

Figure 2-19: PSTN

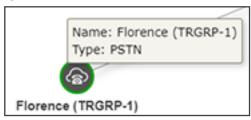

Figure 2-20: IP Phone

> To edit a VoIP Peer:

Right-click the VoIP Peer icon and choose **Edit** from the popup.

Figure 2-21: Edit VoIP Peer

 You can edit the 'Name' of the VoIP Peer and/or select the 'Peer Type' from the drop-down menu.

> To delete a VoIP Peer:

Right-click the VoIP Peer icon and then choose **Delete** from the popup menu.

The **Delete** option is only available if no Peer Connection or routing rules are associated with the VoIP Peer. If there are, you must first update / delete routing rules before you can delete the VoIP Peer. You must then associate the Peer Connection with another VoIP Peer.

Connection Information and Actions

In the Network page, Map view, you can view connection information and perform connection actions.

> To view connection information:

1. Point your cursor over the connection whose information you want to view.

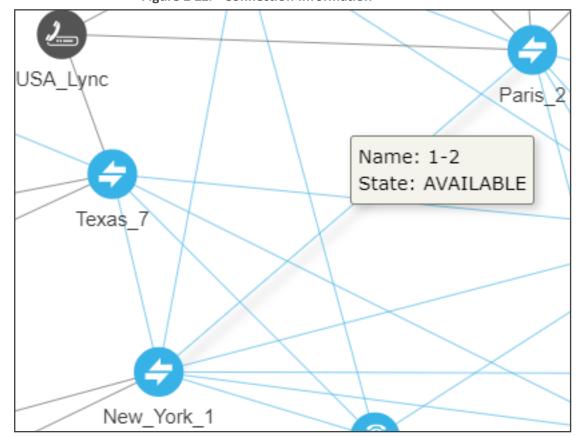

Figure 2-22: Connection Information

2. View the Name and the State of the connection.

> To perform an action on a connection:

1. In the popup menu, click Edit -or- Delete. [Note that Add connection, Edit and Delete are also available as action buttons in the Network Map page].

EDIT CONNECTION 6-7 Name Weight Transport Type UDP ۳ Node-1 Node-2 New_Jersey_6 ₹ Texas_7 ₹. Routing Interface-1 Routing Interface-2 SIP-c SIP-c ۳ ۳ Advanced Conditions use global use specific ■ MOS ■ ASR Cancel OK

Figure 2-23: Edit Connection

2. You can edit the:

- name of the connection
- Weight (Range: 0-100. Default: 50)
- Transport Type (Default: UDP)
- 3. Leave the option use global at its default for quality-based routing to be applied using global (ARM level) settings. Select use specific to overwrite the global settings of quality-based routing condition for a specific connection, and then select the enabled 'MOS' and/or 'ASR' option (see Routing Settings on page 146 for related information).

Peer Connection Information and Actions

In the Network page Map view (Network > Map), you can view information about each Peer Connection and perform Edit, Delete, Lock/Unlock, Test Route and Detach actions on Peer Connections.

- The **Delete** option is displayed only for Peer Connections in locked and pre-deleted state, unassociated with routing rules or with a Policy Studio rule.
- The **Detach** option is displayed only if the Peer Connection is connected to a VoIP Peer that is connected to more than one Peer Connection.
- The actions Edit, Delete and Lock/Unlock are also available in the Peer Connections page (Network > Peer Connections).

> To view Peer Connection information:

1. In the Network page Map view, point your cursor over the peer connection whose information you want to view.

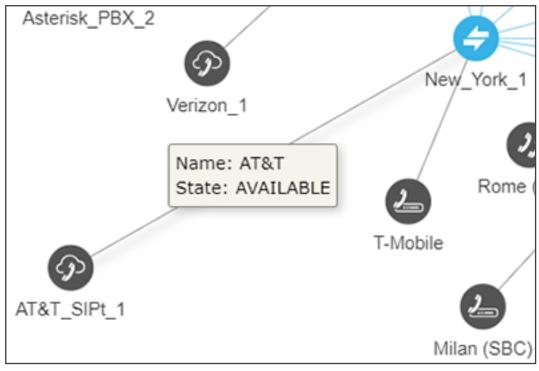

Figure 2-24: Peer Connection Information

2. View the Peer Connection's Name and State.

> To perform an action on a Peer Connection:

1. In the Network page Map view, right-click the Peer Connection and choose **Edit** from the popup menu. The same action can be performed by selecting the Peer Connection and then clicking the **Edit** button.

The **Edit** action is also available in the Peer Connections page (**Network > Peer Connections**); select the Peer Connection and then click the **Edit** button.

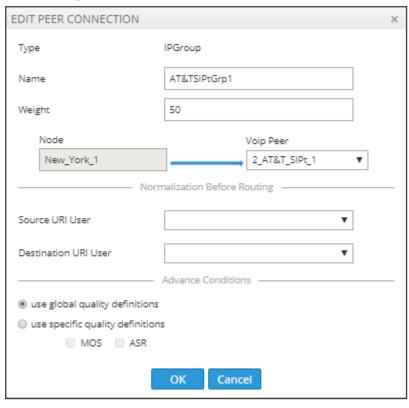

Figure 2-25: Edit Peer Connection

- **a.** Modify the weight (Range: 0-100; Default: 50) for the ARM to calculate the optimal call path. Use if you have a VoIP Peer as a Routing Rule action and you want to prioritize a specific Peer Connection (e.g., SIP trunk) to be chosen for calls routing. Also use to reflect Peer Connection cost or bandwidth.
- **b.** From the drop-down menu, select the VoIP Peer that this Peer Connection is connected to.
- c. From the drop-down menus, select the Normalization Rule for Source and Destination URI User if pre-routing manipulation is required for a specific Peer Connection (configured as shown in Adding a Normalization Group on page 132).
- d. Leave use global quality definitions selected (default) for this Peer Connection to use the global quality profile configured as shown in Configuring Criteria for a Quality Profile on page 146.
 - Select **use specific quality definitions** for this Peer Connection to use only the 'MOS' or the 'ASR' criteria of the quality profile configured as shown in Configuring Criteria for a Quality Profile on page 146.
- 2. In the Network page Map view, right-click the Peer Connection and choose Lock / Unlock from the popup menu as shown in the figure below left. The same action can be performed in the Network page Map view by selecting the Peer Connection and then clicking the Edit button as shown in the figure below right.

IpGrn State: AVAILABLE

Lock Lock
Lock Lock Lock Lock Outgoing
Test Toute

Lock Outgoing

Unlock

IpGrp1_S2_VolPPeer

Lock/Unlock

Test route

Lock Outgoing

Unlock

IpPeer

Figure 2-26: Lock / Unlock Peer Connection

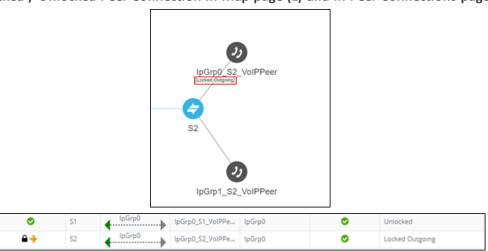

The **Lock** / **Unlock** action is also available in the Peer Connections page (**Network** > **Peer Connections**); select the Peer Connection and then click the **Edit** button.

In addition to **Lock / Unlock** of a Peer Connection, you can select a *directional based* **Lock / Unlock**. This feature allows you to (for example) stop *only traffic towards* a specific VoIP Peer (for example, a specific IVR) while *calls coming from* this VoIP Peer will still be routed to their destination. You can use the feature to perform a graceful stoppage of traffic for maintenance reasons (for example). The feature is essential for IVR VoIP Peers when there are always calls in a queue that are not yet connected to an agent. From the IVR's perspective, the connection to the agent is outbound calls; without the uni-directional lock feature, calls fail.

The directional lock of a Peer Connection is indicated in Map page and in the Peer Connections page.

Figure 2-27: Locked / Unlocked Peer Connection in Map page (L) and in Peer Connections page (R)

- **3.** In the Network Map page, right-click the Peer Connection and choose **Test Route** from the popup menu (see **Testing a Route** on page 59 for more information).
- **4.** Optionally, you can **Delete** the Peer Connection. Only Peer Connections in locked and predeleted state, unassociated with routing rules or with a Policy Studio rule, can be deleted.

The action **Delete** is also available in the Peer Connections page (**Network** > **Peer Connections**); select the Peer Connection and then click the **Delete** button. The **Delete** action is displayed only for Peer Connections in locked and pre-deleted state, unassociated with routing rules or with a Policy Studio rule.

5. If the Peer Connection is connected to a VoIP Peer that is connected to more than one Peer Connection, you can click **Detach**. You'll be prompted to define a name for a new VoIP Peer. The **Detach** action is displayed only if the Peer Connection is connected to a VoIP Peer that is connected to more than one Peer Connection.

Repositioning Elements in the Network Map Page

The ARM's Network Map page allows you to move and reposition multiple selected elements - Nodes and VoIP Peers — simultaneously to facilitate a friendlier operator experience and to decrease operator vulnerability to routing configuration errors.

You can select a combination of elements and move and reposition them simultaneously with your mouse device. After moving / repositioning elements, you need to perform a save else they'll be restored to their original position in the following session.

Even when managing very large networks with extended numbers of topology elements (Nodes and VoIP Peers), the ARM agilely performs relocations in the page.

When moving / repositioning elements in the page, you can also use the **hide edges on drag** option available from the 'Diagram Configurations' icon.

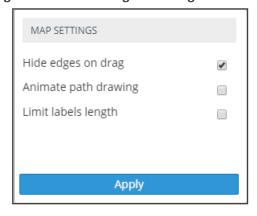

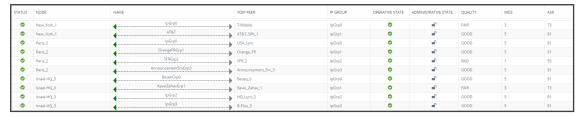

Figure 2-28: Hide Edges on Drag

When selected, Connections and Peer Connections are not displayed in the page when an element (or multiple elements) is moved and repositioned. The option provides a less cluttered view of network elements in the page, facilitating more effective relocation.

Peer Connections Page Actions

In the Peer Connections page (**Network** page > **Peer Connections**) you can view the Peer Connections.

Figure 2-29: Peer Connections

The following information on each Peer Connection is displayed:

- Status
- Node
- Name
- VolP Peer
- IP Group
- Operative State
- Administrative State
- Quality
- MOS
- ASR

The information displayed in the Peer Connections page is identical to that displayed in the Network Map view described under Peer Connection Information and Actions on page 36. You can search for the name of a Node associated with the Peer Connection, the name of a Peer Connection, or a VoIP Peer name. It's useful to find, for example, all Peer Connections of a specific Node.

Use the buttons in the Peer Connections page to perform the following actions:

- Sync Topology
- **Edit** after selecting the row of the Peer Connection to edit. For more information, see under Peer Connection Information and Actions on page 36.
- Delete after selecting the row of the Peer Connection to delete. Note that the Delete option is displayed only for Peer Connections in locked and pre-deleted state, unassociated with routing rules or with a Policy Studio rule. for related information, see under Peer Connection Information and Actions on page 36.
- **Lock/Unlock** after selecting the row of the Peer Connection to lock/unlock. For more information, see under Peer Connection Information and Actions on page 36.

In addition to **Lock** / **Unlock** of a Peer Connection, you can select a *directional based***Lock** / **Unlock**. This feature allows you to (for example) stop *only traffic towards* a specific VoIP Peer (for example, a specific IVR) while *calls coming from* this VoIP Peer will still be routed to their destination. You can use the feature to perform a graceful stoppage of traffic for maintenance reasons (for example). The feature is essential for IVR VoIP Peers when there

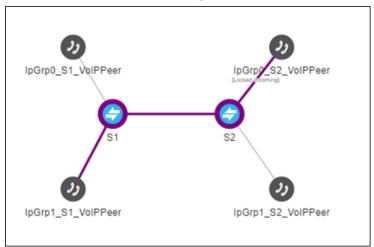

are always calls in a queue that are not yet connected to an agent. From the IVR's perspective, the connection to the agent is outbound calls; without the uni-directional lock feature, calls fail.

The directional lock of a Peer Connection is indicated in Map page and in the Peer Connections page.

- A lock of the opposite direction automatically unlocks the previous lock direction; it doesn't apply a bi-directional lock; it allows traffic of the previously locked direction. Either direction is applicable.
- The Offline Planning page (Network > Offline Planning) as well as the Test
 Route feature support direction-based lock. In the example shown in the figure
 below, Test Route is activated (and allowed) for outgoing calls even though the
 Peer Connection is locked for incoming calls.

Figure 2-30: Test Route Activated for Outgoing Calls even though the Peer Connection is Locked for Incoming Calls

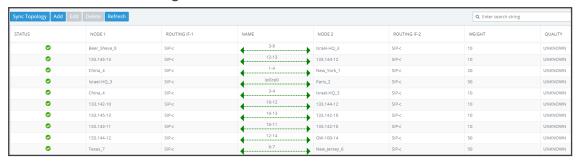

- Multiple rows can be selected; multiple actions (delete, lock/unlock, etc.) are supported.
- For more information about Sync Topology, see Synchronizing Topology on page 57.
- For more information about the **Edit**, **Delete** and **Lock/Unlock** actions, see under Peer Connection Information and Actions on page 36.

Connections Page Actions

In the Connections page (**Network** > **Connections**) you can view the connections you defined.

Figure 2-31: Connections

You can view the following information on each connection:

- Status
- Node 1
- Routing Interface 1
- Name
- Node 2
- Routing Interface 2
- Weight
- Quality

The Search functionality is allowed for all the relevant information fields: Node Name, Connection Name, Weight or Routing Interface.

The information displayed in the Network page's Connections view is identical to that displayed in the Network Map view described under Connection Information and Actions on page 35.

You can perform the following actions:

- Sync Topology
- Add Connection (after selecting the row of the connection to edit)
- Edit Connection (after selecting the row of the connection to edit)
- Delete Connection (after selecting the row of the connection to edit)
- Refresh

Multiple rows can be selected and multiple delete is supported. For more information about Sync Topology, see Synchronizing Topology on page 57. For more information about the Add, Edit and Delete Connection, see under Connection Information and Actions on page 35.

Do not modify the SBC-level / gateway-level configuration of the connections created by the ARM. It will disrupt routing decisions/performance.

Resource Groups Page Actions

The Resource Groups feature allows network administrators to add and view a group of ARM topology resources of the same type. The Resource Groups page (**Network** > **Resource Groups**) allows operators to view defined Resource Groups and determine at a glance the elements defined in each. The page also allows operators to add, edit and delete Resource Groups. Each Resource Group can only comprise one type of element: Node, Peer Connection or VoIP Peer.

Operators can use

- a Resource Group comprising Nodes or Peer Connections as the source of a call in a Routing Rule
- a Resource Group comprising Nodes or Peer Connections as the source Resource Group in a Policy Studio rule
- any Resource Group as the action of a routing rule action

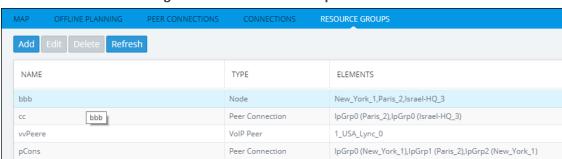

Figure 2-32: Resource Groups

To add a Resource Group:

1. In the Resource Groups page, click the **Add** button.

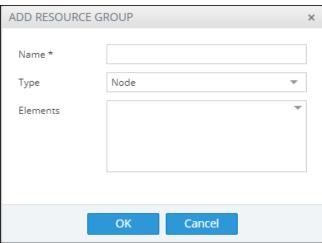

Figure 2-33: Add Resource Group

- **2.** Enter a name for the Resource Group that is distinct from the names of other Resource Groups; define a user-friendly name to facilitate intuitive routing management later.
- 3. From the 'Type' drop-down, select either:

- Node
- Peer Connection
- VoIP Peer
- **4.** From the 'Elements' drop-down, select the Nodes, Peer Connections and / or VoIP Peers to include in the Resource Group and click **OK**.

- To edit or delete a defined Resource Group, select it in the Resource Groups page and then click Edit or Delete.
- Operators can edit the elements comprising the Resource Group and / or the name of the group.
- After defining a new Resource Group, the group type cannot be changed (for example, from a Nodes group to a VoIP Peers group).

Viewing Network Summary Panes

Network Summary panes viewed in the right margin of the Network Map page can inform you how to optimize call routing in the network. You can choose to display:

- Overall Network Statistics statistics related to the *entire network* are displayed by default; no entity in the Network Map is selected. See Overall Network Statistics below.
- Statistics on a network entity select the network entity in the Network Map for which to display statistics. See Statistics on a Selected Entity on page 49.

Overall Network Statistics

Statistics related to the entire network are by default displayed. No entity in the Network Map is selected. This pane displays four sections:

- Network Summary (see below)
- General Statistics (see General Statistics on the next page)
- Top 5 Routes (see Top 5 Routes Pane on page 48)
- Test Route (see Test Route on page 49)

Network Summary

The Network Summary pane displays routing statistics and availability network statuses which help operators optimize routing in their telephony networks, reducing unnecessary consumption of resources and decreasing expenses.

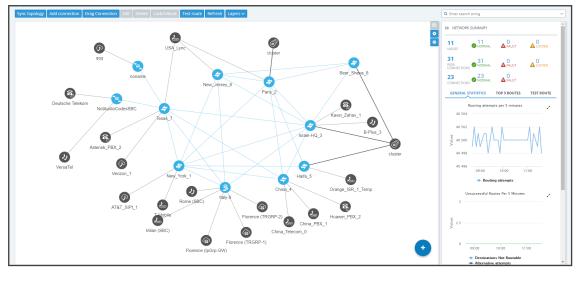

Figure 2-34: Network Summary

The pane displays:

- Network Entities Statuses (left to right):
 - The total number of nodes/Peer Connections/Connections in the network
 - The number of nodes/Peer Connections/Connections that are unlocked and available, i.e., 'normal'
 - The number of nodes//Peer Connections/Connections that are 'fault', i.e., unavailable
 - The number of nodes/Peer Connections that are 'locked' (Connections cannot be locked/unlocked)

When **Quality Layer** is selected, the 'Faulty' counters for Peer Connections and Connections can change. All **red** (bad), **orange** (fair) or **unknown** Connections / Peer Connections are considered 'Faulty' because they less than perfect.

General Statistics

You can display statistics related to the entire network.

- > To display statistics related to the entire network:
- Open the ARM's Network Map and in the Network Summary window, click the **General Statistics** tab if it isn't activated already.

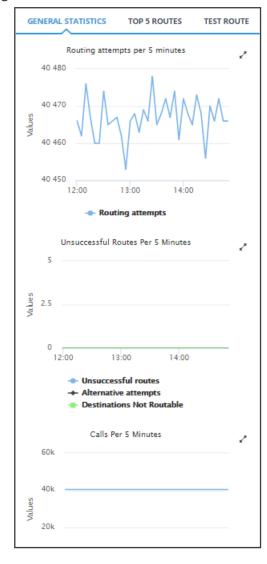

Figure 2-35: General Statistics Pane

Three graphs are displayed (top to bottom):

- The number of routing attempts made in the entire network every five minutes
- The number of unsuccessful routes made every five minutes, including the number of alternative attempts and the number of unrouteable destinations
- The number of calls made every five minutes, including the number of destination calls and the number of transient calls.

> To facilitate your analysis:

Click the expand icon next to any of the three graphs to project a zoomed-in graph to the front.

Figure 2-36: Projecting a Zoomed-in Graph to the Front

Top 5 Routes Pane

The Top 5 Routes pane under the **Top 5 Routes** tab in the Network Summary pane gives operators visibility into the routes most frequently used over the last three hours.

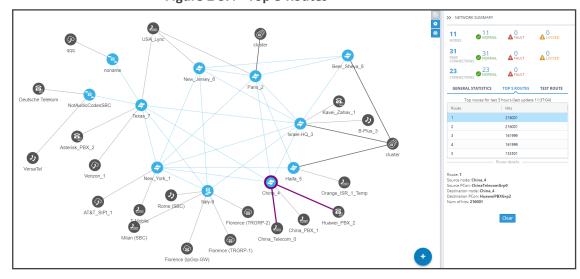

Figure 2-37: Top 5 Routes

Select a route to display its details. In the preceding figure, Route 1 is selected by default after opening the **Top 5 Routes** tab. In the figure following, Route 5 is selected. Details displayed include Source Node / Peer Connection and Destination Node / Peer Connection.

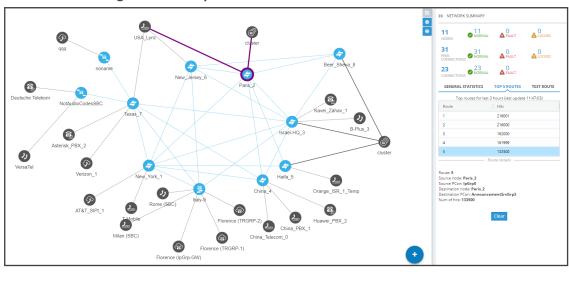

Figure 2-38: Top 5 Routes – Details of Route 5

Selecting Route 1-5 (one of the top five routes) visualizes the path in **bold purple** in the Network Map as shown in the preceding two figures.

Test Route

See Testing a Route on page 59 for detailed information.

Statistics on a Selected Entity

When you select one of the entities in the map, the Network Summary window displays statistics related to that selected entity.

| Calls Fer 5 Minutes | Security | Security

Figure 2-39: Summary Pane Displaying Information Related to a Selected Entity - Connection

Note in the figure above that the entity selected, the connection between Paris_2 and

 ${\bf New_York_1}$, is shaded. Information on the selected entity is displayed in the Summary pane on the right side of the page.

3 Defining a Network Topology

Part of the ARM's network topology is automatically discovered and added to the ARM's Network Map.

Other entities must be provisioned by you.

When defining network topology, for example, when adding a node:

- mandatory fields are marked with an asterix *
- an edited field or a field currently being edited is highlighted yellow
- a field with missing or incomplete information is outlined red

Adding an AudioCodes Node to the ARM

AudioCodes nodes (SBCs and gateways) are automatically detected and displayed in the ARM's Network Map, allowing you to begin configuring actions immediately after auto-detection. However, to prevent potential provisioning mistakes at the Node (SBC or Gateway) level, it's preferable to add Nodes to the ARM from the ARM Network Map page.

When a new node is added either by auto-detection or manually to the ARM, the ARM automatically detects Peer Connections and Routing interfaces associated with the node.

> To manually add a node to the ARM:

1. Click the icon and then drag and drop the AudioCodes node into the Network Map, as illustrated in the following figure. The icon changes to x.

Figure 3-1: Drag AC Node

- 2. In the Add Node screen that opens shown in the figure following, provide a name, IP address or Hostname (FQDN), and protocol. The option to use Hostname (FQDN) rather than a hard-coded IP address gives you added flexibility when designing your telephony network.
- **3.** From the 'Routing server group' drop-down, select a Routing Server Group (for more information, see <u>Adding a Routing Servers Group with Internal and External Priorities</u>).

ADD NODE

Name *

Address *

Protocol

Routing server group

The node will be unrouteable as no routing server group was picked

Credentials *

OK

Cancel

Figure 3-2: Node Name | IP Address / Hostname (FQDN) | Protocol

4. Hostname (FQDN) can be configured for an existing node in the node's Web interface, Network Settings page. The page is opened by right-clicking the node in the ARM's Network Map page to log in, selecting the IP Network menu, opening the Advanced tab and then selecting the Network Settings tab.

Figure 3-3: Node's Web Interface - Network Settings Page – Host Name (FQDN)

This triggers a new login message from the node to the ARM; the ARM consequently updates the address to the newly added Hostname (FQDN). If the ARM detects a node configured with both Hostname (FQDN) and IP address, Hostname (FQDN) is used. You can change Hostname (FQDN) or IP address. The ARM displays the device's address, i.e., Hostname (FQDN) if it exists, or IP address (if Hostname (FQDN) doesn't exist).

5. View the added AudioCodes node in the Topology Map; all elements associated with the node are automatically provisioned and displayed in the Network Map.

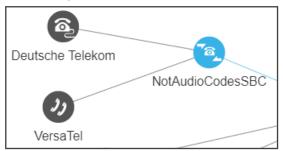

- Peer Connections are displayed in Locked state; you need to perform an unlock for them to provide a service.
- Node provisioning by auto-detection is described in Migrating Device Routing to the ARM on page 210.

Adding a Third-Party Node to the ARM

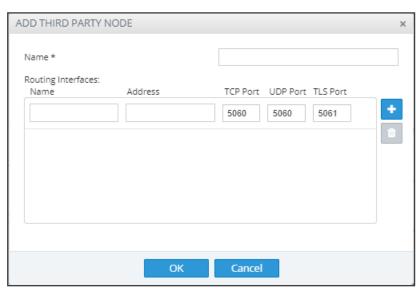

The ARM allows you to add third-party non-AudioCodes nodes (SBCs and Media Gateways) to the Network Map so that the ARM can be used for call routing in heterogeneous environments with a mix of AudioCodes and non-AudioCodes nodes as part of your network.

Figure 3-4: Third-Party Device Added to the Network Map

> To add a third-party node:

1. In the Network Map page, click the icon located in the lowermost right corner and then drag and drop the third-party node icon into the Network Map.

- 2. Provide the third-party node's properties. The third-party device's remote IP address is used as the destination address of the connection from the AudioCodes device.
- 3. Click **OK** and then add a VoIP Peer as shown in Adding a VoIP Peer below.

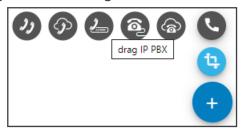

Adding a VoIP Peer

After adding a third-party non-AudioCodes node (SBC or Media Gateway) to the ARM Network Map as shown in Adding a Third-Party Node to the ARM above, add a VoIP Peer.

> To add a VoIP Peer:

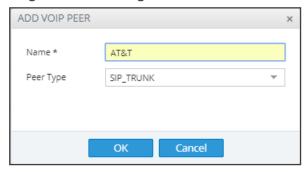

Figure 3-5: Adding a VoIP Peer

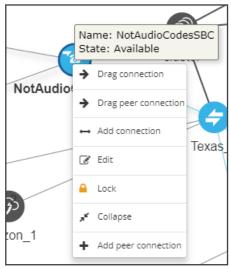

2. From the VoIP Peer types displayed, drag the VoIP Peer type you require, e.g., IP PBX or SIP Trunk, and drop it in the Network Map. Use the preceding and following figure as references.

Figure 3-6: Adding a VoIP Peer

- 3. In the 'Add VoIP Peer' screen that opens, give the VoIP Peer a name and click **OK**.
- **4.** Associate the VoIP Peer with the third-party non-AudioCodes node: Right-click the node and from the pop-up menu select the action **Drag peer connection**.

Figure 3-7: Drag peer connection

The action 'Drag peer connection' is available only to third-party non-AudioCodes SBCs or Media Gateways. It's not applicable to AudioCodes SBCs or AudioCodes Media Gateways.

5. From the third-party non AudioCodes node, drag your mouse towards the VoIP Peer as shown here:

Figure 3-8: Drag from the Third-Party Node to the VoIP Peer to Create a Peer Connection

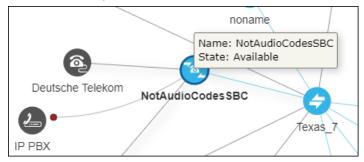

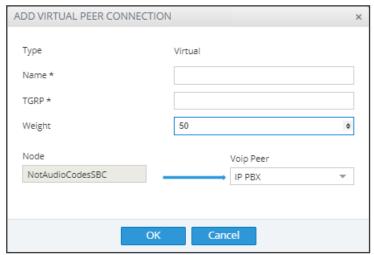

Figure 3-9: Add Virtual Peer Connection

6. In the Add Virtual Peer Connection screen that opens (shown in the preceding figure), connect the third-party node to the ARM topology - to an AudioCodes node or to a SIP module - for end-to-end routing capabilities.

The ARM uses standard SIP TGRP capabilities to communicate with a third-party device interface that does not support AudioCodes nodes' REST API, so when adding a Peer Connection to a third-party device, you're prompted to provide TGRP. The TGRP must match the configuration in the third-party device. When the ARM chooses to route a call towards a specific Peer Connection of the third-party device, it installs into the SIP Invite the TGRP name configured in the ARM.

The ARM will then perform routing to Peer Connections attached to third-party nodes. In Routing Rules, choose the Peer Connection or VoIP Peer associated with the third-party node and in this way, achieve end-to-end routing in a heterogeneous network.

Adding Connections

You can configure a connection between two nodes.

> To add a connection:

1. In the Network Map view, right-click the node from which to configure the connection and in the popup menu click **Add Connection**.

Prag connection

→ Add connection

✓ Configure

✓ Edit

✓ Sync node

★ Build star

New York 1

Figure 3-10: Add Connection

Alternatively, in the Network Map view (1) select the node to which to add a connection and then click the action button **Add connection** or (2) use the **Drag Connection** button.

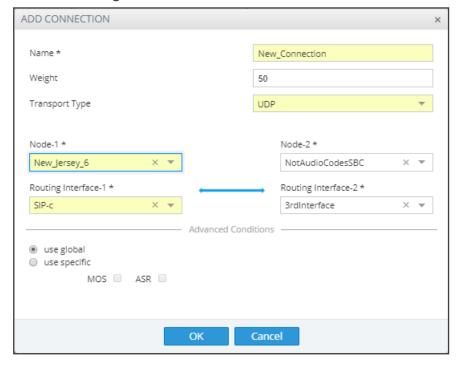

Figure 3-11: Add Connection

- 2. Provide an intuitive name for the connection, to later facilitate user-friendly management in the ARM GUI.
- 3. Select the weight. Default: 50. Range: 1-100.
- 4. From the 'Transport Type' drop-down menu, select UDP (default), TCP or TLS.
- 5. From the 'Node-1' drop-down menu, select the name of the node and from the 'Routing Interface-1' drop-down menu, select its routing interface
- **6.** From the 'Node-2' drop-down menu, select the name of the node and from the 'Routing Interface-2' drop-down menu, select its routing interface
- 7. To define Advanced Conditions (quality-based routing), see Routing Settings on page 146.
- 8. Click **OK**; the connection is made.

Synchronizing Topology

The Sync Topology feature allows you to perform manual synchronization per Node or per global topology synchronization, depending on where the synchronization action was run.

It's important that node status is fully synchronized with the ARM server at all times for the ARM GUI to display the node successfully and for routing to be performed correctly.

For an SBC / Media Gateway to be displayed in the ARM GUI, you need to point it to the ARM server IP address using the Web interface.

The ARM auto-discovers all network entities such as Nodes, Peer Connection and VoIP Peers, associates a VoIP peer with each Peer Connection, and displays them in the Network Map view.

The ARM detects activity originating from a node and puts the node on the map (peer collection). The ARM recognizes a newly added node and extracts all IP groups (i.e., Peer Connections). Users must add connections between nodes and change the VoIP peer types (see under Adding Connections on the previous page).

If a node's status is changed, the ARM detects this when synchronization is performed and automatically maps it. When synchronizing, the ARM obtains the names and statuses of connections and Peer Connections from each node and compares them to what it already knows. The Sync Topology feature therefore makes sure that the ARM is fully identified with the node's identifiers: IP address, credentials, node type, software version.

> To sync:

In the Network Map view or Peer Connections view or Connections view, click **Sync Topology** on the action buttons bar.

Figure 3-12: Sync Topology

Global synchronization of the entire network is performed.

Building a Star Topology

You can build a star topology to enhance effective management. In a star topology, every node selected is connected to a central node:

All VoIP traffic from/to connected star nodes passes through the central node.

> To build a star topology:

1. In the Network Map view, right-click a node and in the popup menu select **Build star**.

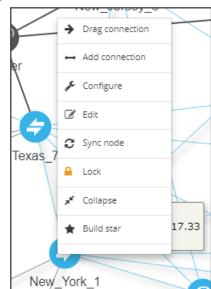

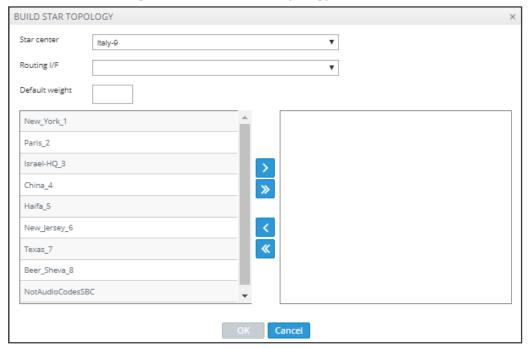

Figure 3-13: Build Star

Figure 3-14: Build Star Topology

- 2. In the left pane of the Build Star Topology screen select the nodes that you want to connect to the star and then click
- **3.** Configure the screen using the following table as reference.

Table 3-1: Build Star Topology

Parameter	Description		
Star cen- ter	The node you pointed your cursor to before selecting the 'Build Star' menu option is displayed in the field; it'll be at the center of the star. To select another node to be at the center of the star instead of this node, from the drop-down menu of nodes select the node.		
Routing I/F	Select one of the SIP interfaces from which connections will be made from this node in the star center, to the other nodes in the star. Example: SIP-c SIP-0 SIP-1 SIP-2		
Default weight	Enter the weight 1-100 to be applied to <i>all connections</i> in the star topology build. Later, you can prioritize <i>per connection</i> (see under Connection Information and Actions on page 35 for more information). The ARM uses this setting to select the most optimal routing path for each call. The parameter therefore facilitates more effective network management.		
The builder panes	Use the builder panes to build your topology star. From the left pane, select the nodes to include in the star, and then click >> to move them to the right pane. If you select a single node at a time, select it and then click >. To remove a node from the build, in the right pane click <, or << to remove multiple modes after selecting them.		

4. Click **OK**; the topology is built. You can view it in Topology Map view.

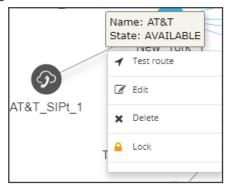

Testing a Route

You can configure and test a route to make sure the call routing rule, the manipulation rule, the topology status, etc., all perform per expectations, without impacting live calls traffic.

> To test a route:

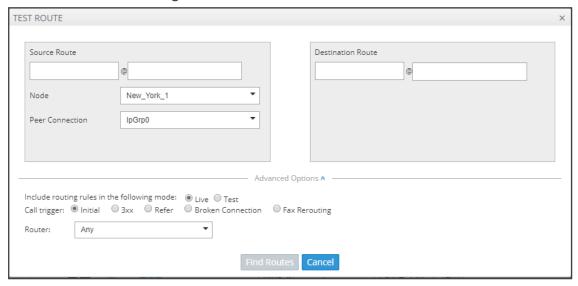

1. In the Network Map view, right-click the connection between a node and a VoIP Peer (Peer Connection). [Alternatively, you can select the connection and then click the **Test Route** button on the Actions Bar].

Figure 3-15: Test Route

2. From the popup menu, select **Test route**.

Figure 3-16: Test Route

- **3.** [Optional] Enter the Source and Destination Route. From the drop-down menu, select the **Peer Connection**.
- **4.** Under 'Advanced Options', select the routing rules mode:
 - **Live**. When a new call destination is calculated, the Routing Rule is taken into consideration and live traffic may be impacted.
 - **Test**. Tests the Routing Rule or Dial Plan *offline* without impacting or disrupting live calls traffic.
 - **Live** and **Test** selected together. The Routing Rule is considered when:
 - calculating the live routing path -and-
 - testing a route in the live topology map and in the offline planning page

Each routing rule can be enabled or disabled separately for **Live** mode and / or **Test** mode (see also under Adding a New Routing Rule on page 170).

- Under 'Advanced Options', select the call trigger. By default, the Initial option is enabled.
 See step 11 under Adding a New Routing Rule on page 170 for more information about call triggers.
- 6. Optionally, test the route with a specific ARM Router (also supported in 'Test Route' activated from 'Offline Planning'): Under 'Advanced Options', select from the 'Router' drop-down:
 - Any (default) = the ARM Configurator contacts any ARM Router to perform a 'Test Route' and get the results; the ARM Router is chosen randomly.
 - Select a specific ARM Router for a test call.

Use this feature for debugging and locating potential issues.

7. Click Find Routes. Test routing is performed as if a real call is occurring, taking Operative State and Admin State of topology entities (Connections, nodes, Peer Connections), and the Admin State of routing rules, into account. In addition, the entity's Quality or Time/Date criteria are taken into consideration if required by the Routing Rule (Advanced Condition). The Route Path is highlighted purple (shown in the following figure); the panes on the right of the page display detailed information.

Deutsche Tellekom

Deutsche Tell

Figure 3-17: Test Route Paths

Test Route displays forking. If Test Route criteria match a Routing Rule with Forking Routing Method, it's displayed accordingly in the Paths section as shown below.

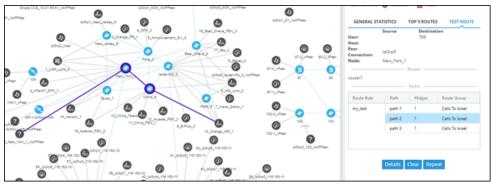

GENERAL STATISTICS TOP 5 ROUTES TEST ROUTE Source Destination User: 789 Host: Peer lpGrp5 Connection: New_York_1 Node: Router router1 Paths Route Rule Path #Edges Route Group Calls To Israel my_test path 1 Calls To Israel path 2 Calls To Israel path 3 Details Clear Repeat

Figure 3-18: Test Route Paths

8. Select a path (path 1, 2 or 3 in the preceding figure); that path of the call's forking is displayed in a unique color on the map as shown in the following three figures. Note that for each forking leg (forking path), its details are available.

Figure 3-19: Forking Path 1

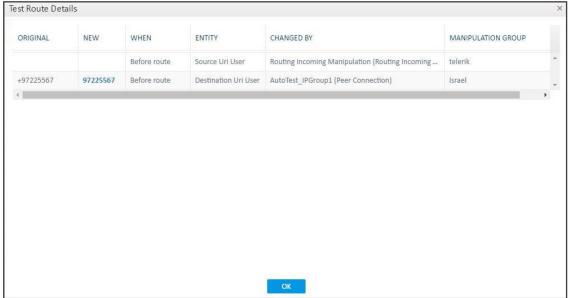

| Contract | Contract

Figure 3-21: Forking Path 3

9. In the Test Route pane, click the **Details** button.

Figure 3-22: Test Route Details

10. In the example above:

- Compare the column ORIGINAL to the column NEW; the number changed because of a normalization rule that was applied. The normalization rule was configured in the Normalization Group rules attached to the Peer Connection.
 - For related information, see also under Peer Connections Page Actions on page 40 and Examples of Normalization Rules on page 230.

Figure 3-23: Strip + from the Number

- Column WHEN indicates when manipulation was performed, i.e., *before* or *after* routing. In the example above, manipulation was performed *before routing*.
- Column ENTITY indicates which part of the SIP Request was manipulated.
 - Possible values: Source URI User, Source URI Host, Destination URI User,
 Destination URI Host, Destination IP Address, Destination Port, Destination
 Protocol, User Credential User Name, User Credential Password
- Column CHANGED BY the first row indicates by global Normalization Group see under Adding a Normalization Group on page 132 and Normalization Before Routing on page 137 for detailed information; the second row indicates that the normalization was attached to a Peer Connection - see under Peer Connection Information and Actions on page 36 for detailed information.
- Column NORMALIZATION/MANIPULATION GROUP indicates which 'Manipulation Group' the entity passed through, according to which regular expression the entity was changed.

- A new Routing Rule is *by default* added in 'Test Mode' (not 'Live'). To test the rule before switching it to live, use the 'Test' option of 'Test Route'.
- After performing Test Route, the results (including the selected path) are preserved in the Network Map even if you switch to another tab. This is convenient when debugging a Dial Plan, after fixing a Routing Rule and reverting to testing it in the Network Map with the 'Test Route' feature.

4 Designing a Network Topology in the Offline Planning Page

The ARM gives operators an add-on to design an IP network in the Offline Planning page starting from the beginning.

Operators can alternatively import an existing live topology into the page, make changes to entities' configuration and statuses, and test how the changes impact network functionality.

Feature benefits:

- Saves expenses in the network design phase | maintenance phase
- Prevents routing errors from occurring
- Decreases maintenance windows

The Offline Planning page is essentially a Map view that can be used as a sandbox for network design and testing purposes.

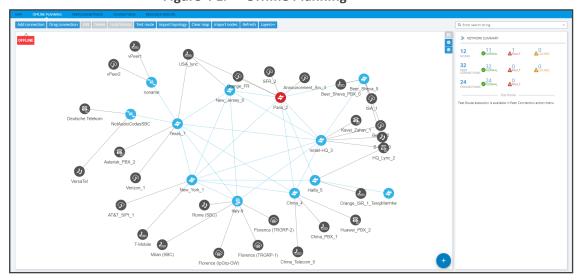

Figure 4-1: Offline Planning

In the view, the operator can create virtual nodes, Peer Connections, VoIP Peers, and Connections. The operator can import a full, currently-used topology, or part of one, e.g., a specific node, for making changes and testing offline.

The operator can 'play' with the Administrative State, Operative State, Quality and Weight - if available - of each virtual entity and test how the changes impact call traffic.

After entities are added to the Offline Planning page they can be used in Routing Rules in testing mode; live network traffic will not be impacted.

The feature allows operators to test almost any scenario before transposing the configuration to the live topology.

The following figure shows the Operative State and Quality settings per peer connection.

EDIT PEER CONNECTION × 1 Name **IPGroup** Туре 50 Weight AVAILABLE ۳ Operative State Quality UNKNOWN ۳ Node Voip Peer 1 Normalization Before Routing Source URI User Destination URI User ۳ OK Cancel

Figure 4-2: Edit Peer Connection

After designing virtual VoIP network entities, you can export them to the live topology. When you export a newly defined node to the live topology, the node configuration downloads to AudioCodes' device which automatically connects to the live topology.

When exporting an offline node to the live ARM topology, only the *connections* in the live node are provisioned; you need to *manually provision* Peer Connections in the node.

Performing Actions in the Offline Planning Page

In the Offline Planning page, you can perform the following actions:

- Add a virtual entity to the Offline Planning page
- Import an existing node and all entities associated with it from the live topology
- Import a full topology from the live topology
- Combine a virtual configuration with an imported one

Adding a Virtual Entity

Two types of virtual entities can be added to the Offline Planning page:

- Nodes
- VoIP Peers

> To add a virtual node:

1. In the Offline Planning page, click and then click; then select the virtual node type or third-party node type using the following table as reference.

Table 4-1: Add a Virtual Node

Icon	Used to	
7 82	Drag and drop a third-party Node onto the Offline Planning page.	
<u> </u>	Drag and drop a virtual <i>hybrid</i> device onto the Offline Planning page.	
6	Drag and drop a virtual <i>gateway</i> onto the Offline Planning page.	
9	Drag and drop a virtual SBC onto the Offline Planning page.	

2. Drag the selected type of device to the map and configure its name.

> To add a virtual VoIP Peer:

1. Click and then; then select the VoIP Peer type using the following table as reference.

Table 4-2: Add a Virtual VoIP Peer

Icon	Used to	
(a)	Drag and drop a PSTN entity onto the Offline Planning page.	
2	Drag and drop a <i>PBX</i> onto the Offline Planning page.	
2	Drag and drop an <i>IP PBX</i> onto the Offline Planning page.	
(J)	Drag and drop a SIP Trunk onto the Offline Planning page.	

2. Drag the icon to the map and configure the name of the VoIP Peer.

CHAPTER ARM | User's Manual

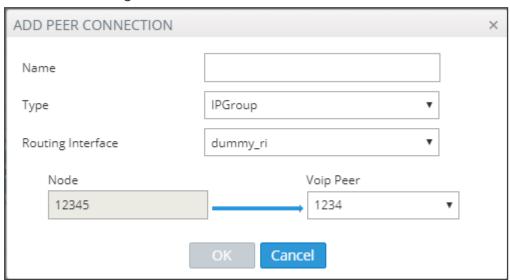

Adding a Virtual Peer Connection to the Offline Planning Page

You can add a virtual Peer Connection to the Offline Planning page.

> To add a virtual Peer Connection:

Drag a line from the center of a node to a VoIP Peer and then configure it in the Add Peer Connection screen that opens:

Figure 5-1: Add Peer Connection

Adding a Virtual Connection

You can add a virtual Connection to the Offline Planning page.

> To add a virtual connection to the Offline Planning page:

Click the Add Connection button to add a connection between two offline nodes; the same screen as the 'Add Connection' screen shown under Adding Connections on page 56 is displayed; the procedure is identical to that performed in the live topology.

Importing a Full Topology

You can import a full topology from the live topology map to the Offline Planning page.

> To import a full topology:

Click the Import topology button; all network entities in the live topology including nodes, VoIP Peers, Peer Connections and Connections will be imported.

Importing a Node from the Live Topology

You can import a node from the live topology to the Offline Planning page.

CHAPTER ARM | User's Manual

> To import a node from the live topology:

Click the Import nodes button and select a relevant node from the list that pops up; the node will be added to the Offline Planning map together with Peer Connections and VoIP Peers associated with that node.

Deleting a Virtual Entity

You can delete a virtual entity from the Offline Planning page.

- > To delete a virtual entity from the Offline Planning page:
- Select an entity and then click **Delete**.
- Click **Clear Map** to delete all entities from the page.

Testing a Route

You can test a route in the Offline Planning page.

> To test a route:

To test a route in a virtual network, select the Peer Connection and then select **Test Route** (see **Testing a Route** on page 59). Testing a route in the Offline Planning page factors in all entities configured in the Offline Planning page and their status and voice quality.

Exporting a Node from the Offline Page to the Live Topology

You can export a node from the Offline Planning page to the live topology.

➤ To export a node from the Offline Page to the live topology:

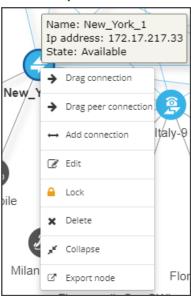

Before exporting a node to the live topology, make sure it's correctly configured in the Offline Planning page. If a node with the same IP address already exists in the live topology, the entire configuration of the node will be transferred to that node in the live topology. Before exporting a node to the live topology, make sure all Peer Connections (IPGroups) are configured on that node.

In the Offline Planning page, right-click the node and from the popup menu select **Export** node.

CHAPTER ARM | User's Manual

Figure 5-2: Export Node

6 Viewing Statistics and Reports

The ARM provides a Statistics Graphs page and ARM-embedded statistics reports, allowing you to debug, monitor and optimize your network and routing. Statistics charts provide you with a clear view of your network and routing performance, helping you better understand, analyze, debug and optimize network routing and resources usage.

> To use statistics graphs:

Open the Statistics Graphs page (Statistics > Graphs).

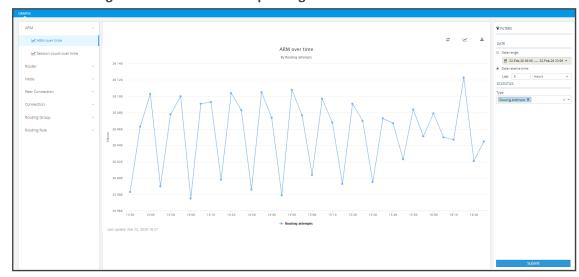

Figure 6-1: Statistics Graphs Page – ARM over time

The page is divided into three sections.

Table 6-1: Statistics Graphs Page (From Left to Right)

Element	Filters	Graphical Representation
Statistics are displayed per element. Select either: ARM (ARM over time, Session count over time) Router (Routers over time, Top routers, Top routers over time) Node (Nodes over time, Top nodes, Top nodes over time, Nodes by peer connections, Top nodes by peer connections)	Filters differ depending on the element selected. For all elements except Routing Group and Routing Rule, select from: 'Date' ('Range' or 'Relative') Statistics Type: Routing attempts Alternative attempts	Graphic representation of the statistics of the selected element in a chart, with a range of graph functionalities: Refresh Chart type (line, area or stacked area) Export chart

Element	Filters	Graphical Representation
Element Peer Connection (Peer connections over time, Top peer connections, Top peer connections over time) Connection (Connections over time, Top connections over time) Routing Group (Routing groups over time, Top routing groups over time, Top routing groups by rules, Top routing groups by rules) Routing Rule (Routing rules over time, Top routing rules over time, Routing rules by actions, Top routing rules by actions)	 ✓ Unsuccessful routes ✓ Destinations Not Routable ✓ Destination calls ✓ Transient calls (does not apply to Peer Connection) (for Connection, only this filter applies) ✓ Drop routing request ✓ No match rule Elements ✓ Search ✓ Number Stacked Elements ✓ Search ✓ Number Statistics Type (only applies to Routing Group and Routing Rule) ✓ Routing rules attempts ✓ Routing first 	
	match ✓ Routing second	
	match Routing third match	
	Routing rules failures	

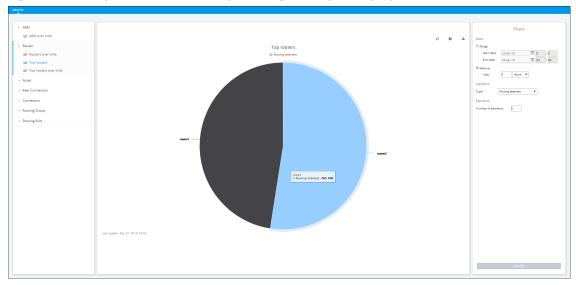

Figure 6-2: Top Routers Filtered by Routing Attempts Displayed as a Pie Chart

- A glance at the chart immediately reveals the top router. Point your cursor over a segment to display the number of routing attempts attempted by that router.
- You can print the chart or download the statistics in a format of your choice.

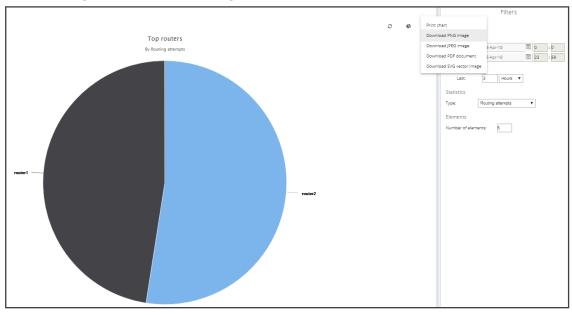

Figure 6-3: Downloading Statistics in a Format of Choice

You can select your preferred graphical representation – bar chart, column chart or pie chart. An icon 'Select chart type' allows you to present statistics according to your preferred graphical representation.

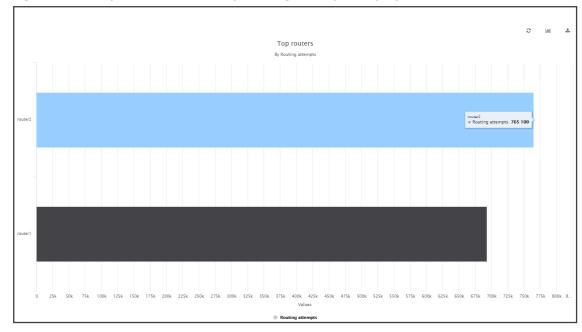

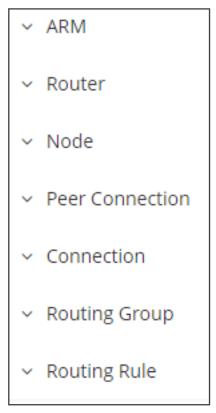

Figure 6-4: Top Routers Filtered by Routing Attempts Displayed as a Bar Chart

A glance at this chart also immediately reveals the top router. Point the cursor over a bar to display the number of routing attempts attempted by that router. The following figure shows the elements that hold statistics information.

Figure 6-5: Elements that Hold Statistics Information

Each element displays subcategories. Under Routing Rule, for example, you can select 'Top Routing rules over time' or 'Top Routing rules by action'.

In addition, in the Filters section of the page, you can select 'Number of elements'.

Figure 6-6: Top Routing rules over time

Statistics pages feature filters in which network administrators can select multiple elements and then *invert the selection*. The feature improves usability and user experience especially in large networks with high numbers of elements. The feature allows network administrators to

- Select a single element
- Delete a single element (x)
- Select All elements
- Clear all selected elements
- Select All and delete a few (x)
- Select All, delete a few (x) and then invert the selection; the elements deleted will be in the selection
- Select a few elements and then invert the selection; only elements that weren't selected will be in the selection
- Clear a selection

7 Performing User-Related Administration

The Users page in the ARM allows the ARM operator to:

- Add users to the ARM (see Adding a User Not Listed in an AD to the ARM below)
- Add Users Groups to the ARM (see Adding Users Groups to the ARM on page 81)
- Add an LDAP Server to the ARM (see Adding an LDAP Server to the ARM on page 87)
- Add a Property Dictionary to the ARM (see Adding a Property Dictionary to the ARM on page 94)

Adding a User Not Listed in an AD to the ARM

Enterprises have databases in which employee information is stored. Enterprises generally store information related to employees on Microsoft's Active Directory (AD) server. The ARM supports multiple ADs. The ARM's user administration feature can connect to an AD and import user calls routing related information into the ARM database. Operators can alternatively add users who are not listed in an AD database, to the ARM database.

Enterprises that store their users in another format (Excel, for example) can also import these users into the ARM as local ARM users using the ARM northbound REST API. For more information and assistance, contact AudioCodes Professional Services.

To view the users listed in the AD database and their AD attributes, you need to provision the LDAP server as shown under Adding an LDAP Server to the ARM on page 87.

> To add a user who is not listed in an AD database, to the ARM database:

1. In the ARM's Users page, click the **Users** tab under the Users menu.

Figure 7-1: Users Page – Users tab

2. Click Add.

User name

Origin ARM

Groups

Contact details

AD groups

Country

Office Phone

Display Name

Department

MS Lync Line URI

Talkers

OK Cancel

Figure 7-2: User Details

User Details are taken from the Property Dictionary screen. If a property is added in the Property Dictionary screen, it appears here. To add a property, see Adding a Property Dictionary to the ARM on page 94.

If an LDAP server is provisioned, the ARM automatically brings users from it to the ARM database, and displays them in the GUI under the **User** tab.

3. Click **OK**; the user is added and displayed in the Users page. To view and / or edit, select the user's row and click **Edit**; the screen shown below is displayed.

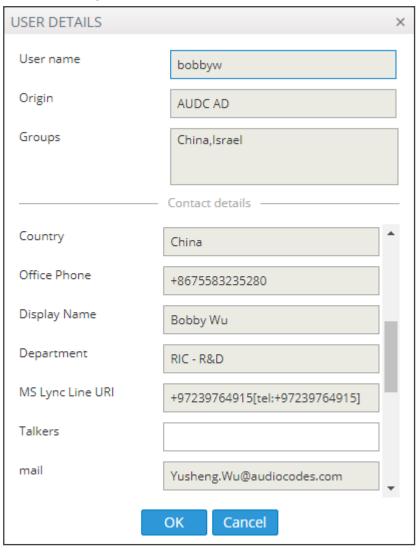

Figure 7-3: User Details

Grayed fields in the figure above indicate that the origin of this user isn't ARM and cannot be edited. Non-grayed fields indicate that the origin of the user is ARM and can be edited.

Viewing Registered Users in the ARM

The Registered Users page lets operators view the SBC registered users that were added to the ARM as shown in Adding Registered Users to the ARM on page 124. After SBC registered users are added to the ARM, the ARM will be capable of performing call routing based on SBC user registrations. When defining a Routing Rule, operators will be able to route calls to SBC registered users (see Adding a New Routing Rule on page 170). The destination to which to route the call will depend on where - which SBC - the user performed the registration. In the Routing Rule definition, operators will select the appropriate routing condition, namely, that the call destination is an SBC registered user.

> To view SBC registered users added to the ARM:

 After adding SBC registered users to the ARM, open the Registered Users page (Users > Registered Users).

Figure 7-4: Registered Users

ISERS	REGISTERED USERS	USERS GROUPS	LDAP SERVERS	PROPERTY DICTIONARY	
Refresh					
USER			HOST	NODE	PEER CONNECTIONS
101			1.1.1.1	New_York_1	IpGrp3
102			1.1.1.1	New_York_1	IpGrp3
103			1.1.1.1	New_York_1	IpGrp3
104			1.1.1.1	New_York_1	IpGrp3
105			1.1.1.1	New_York_1	IpGrp3
106			1.1.1.1	New_York_1	IpGrp3
107			1.1.1.1	New_York_1	IpGrp3
108			1.1.1.1	New_York_1	IpGrp3

IpGrp3

Paris_2

IpGrp0

OrangeFRGrp1

Figure 7-5: Viewing Registered Users from a Specific Node or Peer Connection

This feature allows network administrators to select and view only users registered with a specific node (SBC/Gateway) and/or Peer Connection (IP Group) (for example). The feature facilitates quick access to information by excluding unwanted information from the page.

Adding Users Groups to the ARM

You can define Users Groups by defining a set of criteria in the user properties. The ARM automatically associates users with the defined Users Group, based on the conditions you define. You can then use the Users Groups in your Routing Rules as match conditions. Each Users Group has one 'Dialable Number' attribute. When a route request is received with a source or destination URI matching the group's 'Dialable Number' property for one of the users in the group, the Routing Rules with this source or destination Users Group are matched.

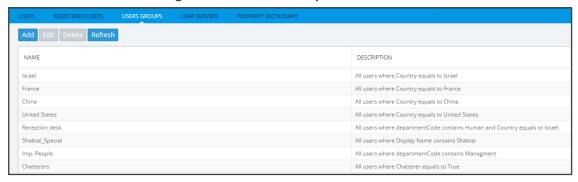

A Users Group can have a single attribute condition or a combination of attributes conditions. For a user to be a part of the Users Group, all the conditions must be matched. A single condition can have a set of values to compare to. If any of the values of the condition are matched, the condition is considered a match.

Example: You can define a Users Group where the 'Dialable Number' attribute is 'Mobile phone number' and the conditions are Country equals Germany and Department equals Marketing or Sales.

> To add a Users Group:

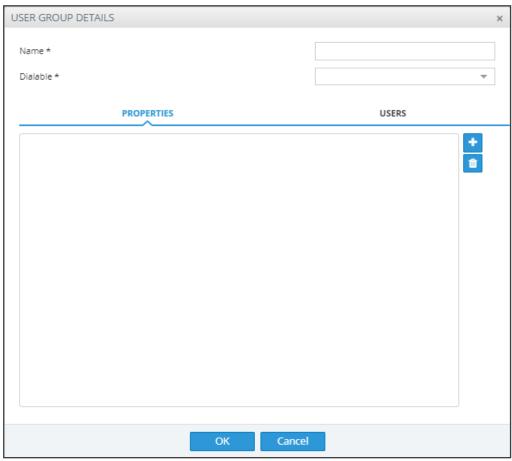

1. In the Users page, click the **Users Groups** tab.

Figure 7-6: Users Groups

2. Click Add.

Figure 7-7: User Group Details

3. Configure the details using this table as reference.

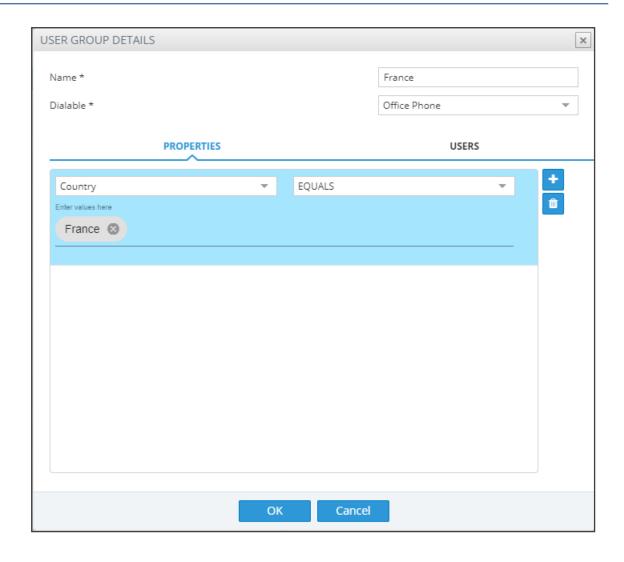

Table 7-2: User Group Details

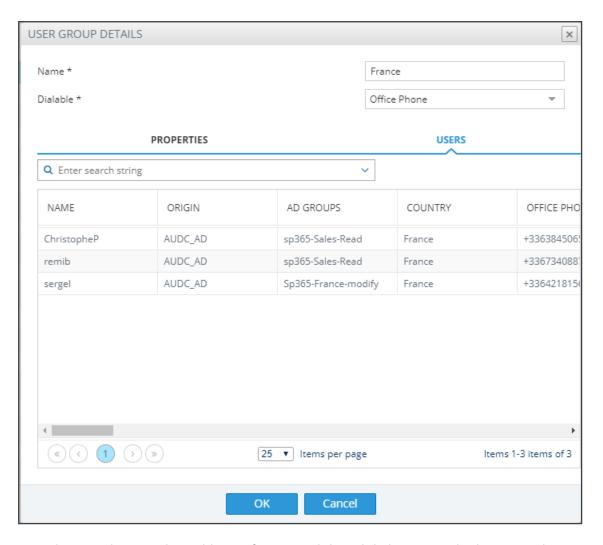

Setting	Description
Name	Enter a name for the group for intuitive future reference.
Dialable	From the drop-down menu, select one of the Dialable Number properties. This is the user's property that is compared to the

Setting	Description
	received source or destination URI to determine if the route request is from/to one of the users in this User Group. Example: 'Office phone number'.
Attribute Name	Click and from the left field's drop-down menu, select a user attribute according to which the user will be associated with the group. Example: Country. Click the button again to add more attributes. All attributes must match for the user to be a member of the group.
equals / not equals contains / not contains	From the right field's drop-down menu, select the operation to be used to define the criterion.
Enter values here	Enter a value for the attribute, according to which the user will be associated with the group. Example: Sweden. Press enter to add more values. At least one of the values must match for the attribute to be considered a match.

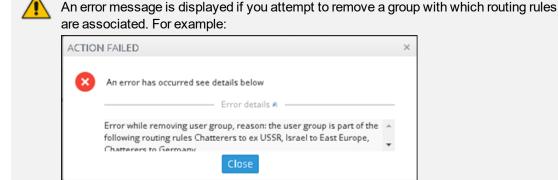

> To edit a Users Group:

1. In the Users Groups page, select the user group to edit and then click **Edit**; the User Group Details screen opens under the **Properties** tab.

- **2.** Edit using the preceding table as reference and then click the **Users** tab; the screen shown above opens allowing you to view the users who are associated with the group.
- > To delete a Users Group:
 - In the Users Groups page, select the user group to delete and then click **Delete.**

The message indicates the names of the routing rule/s associated with the group so it's easy to find and remove them before deleting the group.

Adding an LDAP Server to the ARM

Network administrators can add multiple Active Directories (ADs) to the ARM database using LDAP protocol.

> To add an LDAP server:

1. In the Users page, click the LDAP Servers tab.

Figure 7-8: Users Page – LDAP Servers tab

2. Click Add.

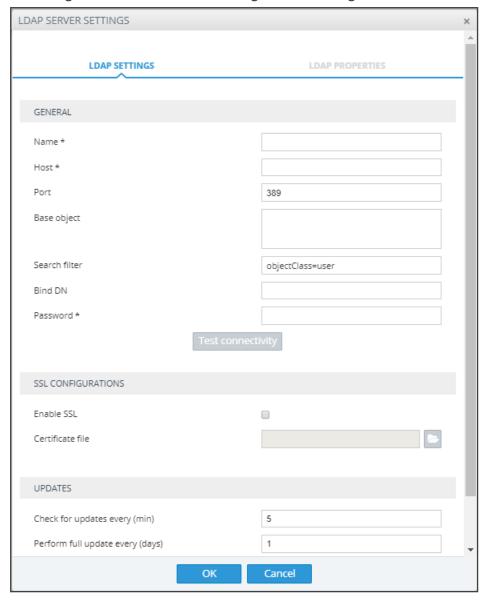

Figure 7-9: LDAP Server Settings - LDAP Settings

3. Configure the settings using this table as reference.

Table 7-3: LDAP Server Settings - LDAP Properties

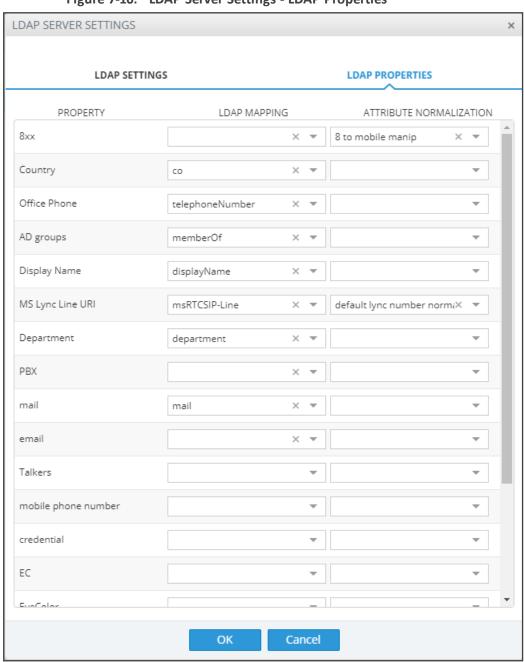

Setting	Description
Name	Enter an intuitive name for the LDAP server.
Host	IP address or DNS name of the LDAP server on which the AD is located.
Port	The LDAP port. Default: 389
Base Object	Consult your IT manager responsible for the Active Directory in your enterprise. The setting defines the full path (DN) to the object in the AD tree where the user's information is located. The valid value is a string of up to 256 characters. Example (read from right to left):

Setting	Description
	ou=Users;ou=APC;ou=Israel;ou=as;dc=corp;dc=as;dc=com The DN path is defined by the LDAP names OU (organizational unit) and DC (domain component).
Search Filter	An LDAP search filter used when fetching the users from the LDAP server under the base DN. The default is 'objectClass=user'.
Bind DN	The DN (distinguished name) or username of the user used to bind to the LDAP server.
	For example: ldap_bind@corp.audiocodes.com
Password	Defines the LDAP password used to connect.
Test Connectivity	Click the button to test the connectivity between the ARM server and the AD server.
SSL Configuratio	ns
Enable SSL	Enables or disables the connection over SSL. Default: Disable. When disabled, communications with the AD server will be open, i.e., unencoded/unencrypted. When left unchanged at the default; the Browse button adjacent to 'Certificate File to Upload' will be unavailable; when enabled, the Browse button becomes available.
Certificate file	Enables verification that it is the AD server and no other entity that is communicating with the ARM server. Allows you to browse for a root certificate. When the AD server then sends a certificate, the ARM server uses the root certificate to verify that it is the AD server and no other entity on the other side. Following verification, communications are SSL-encoded.
Updates	
Check for updates every n minutes	Defines how frequently the ARM server checks the AD server for updates. Note that during the update, the ARM only obtains new AD users or relevant user information updates (only the delta). Default: Every 5 minutes
Perform full update every <i>n</i> days at	Defines how frequently the ARM server performs a full update from the AD server. Note that a full update is mainly required to remove users deleted from the organization's AD (this information cannot be obtained by an AD update). Default: Every day
At	At what time of day the full synchronization (in which the ARM server performs a full update from the AD server) will occur. Default: 0:0, i.e.,

Setting	Description	
	midnight. Use the arrows to navigate to and select a time. In the preceding figure, the sync will occur every 10 days (frequency) at 00:00 hours (midnight). Default: 03:00 a.m.	
Updates timeout	If the AD server doesn't answer within the period configured, the ARM server determines that the AD server is disconnected and a refresh is sent. Default: 60 minutes.	

4. Click **OK** and then click the **LDAP Properties** tab.

Figure 7-10: LDAP Server Settings - LDAP Properties

- Property fields that display LDAP mappings are synced from the LDAP server
 - From the property field's drop-down, select the property to map to the LDAP server -OR- enter the first letter or number in the name of the property and if necessary enter the second as well; the field is automatically populated (filled). LDAP schema typically include multiple attributes so this feature makes it easy for network operators to find an attribute.
- Property fields not displaying LDAP mappings can be mapped locally, in the ARM:
 - ✓ Leave the property's field empty and then in the Users page (Users > Users) open a user's User Details screen and edit the property there according to requirements (see Adding a User Not Listed in an AD to the ARM on page 77)
- In the Property Dictionary page you can define a new property or edit an already defined property (see Adding a Property Dictionary to the ARM on page 94)

> To attach a Normalization Group (Rule) to an LDAP property:

- 1. Select the row of the LDAP property to which to attach a Normalization Group.
- 2. From the property's Attribute Normalization drop-down menu, select a Normalization Group. See Adding a Normalization Group on page 132 for information on how to configure a Normalization Group.
- 3. Click OK.

> To view the AD summary:

In the Users page, click the **LDAP Servers** tab and select the AD whose summary you want to view.

| Mart |

Figure 7-11: Users Page – LDAP Servers tab – AD Summary

Table 7-4: Active Directories Summary

Sync	ARM and AD databases synchronization schedule. Displays the synchronization frequency: 1-48, i.e., between once every hour (most frequent) to once every two days (most infrequent).
Last Sync	Displays the last time the ARM and the Active Directory databases were synchronized.

Full Sync	Displays the time (hour and minute) at which to start a full synchronization. Also displays the frequency: 1-7, i.e., between once a day (most frequent) to once a week (most infrequent).
Last Full Sync	Displays the last time the ARM and the Active Directory databases were fully synchronized.

> To edit an LDAP server:

1. In the Users page under the LDAP Servers tab, select the server to edit and click Edit.

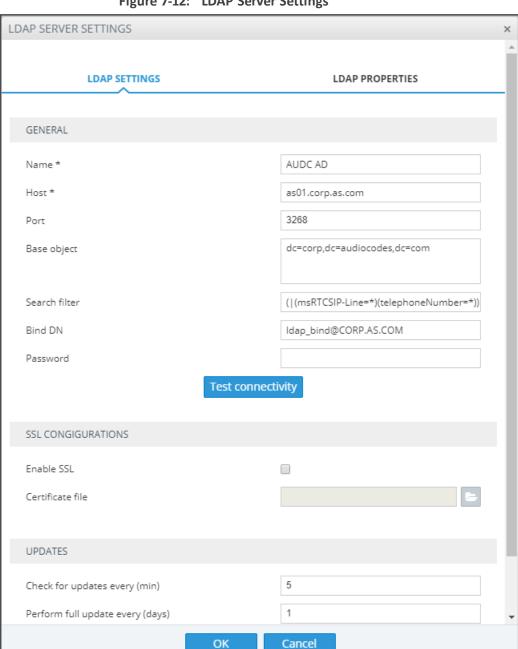

Figure 7-12: LDAP Server Settings

2. Edit the LDAP Server Settings screen using the parameter descriptions when adding an LDAP server as reference, and then click **Test Connectivity** to test the connection settings.

Figure 7-13: Test connectivity

- Click the LDAP Properties tab; the same screen that opens when adding an LDAP server, shown previously, is displayed. Use the parameter descriptions when adding an LDAP server, shown previously, as reference.
 - For each LDAP property's LDAP Mapping drop-down menu, select a mapping.
 Properties that have LDAP mappings are synced from the LDAP server. Properties that do not have LDAP mappings are empty and can be configured locally.
 - Select the LDAP property to which to attach a Normalization Attribute and then from the property's Attribute Normalization drop-down menu, select a Normalization Group. See Adding a Normalization Group on page 132 for information about how to configure a Normalization Group.

4. Click OK.

After updating an LDAP server, a full sync is started. After a short while (depending on the size and responsiveness of the LDAP server), you can view the updated users in the Users page.

Adding a Property Dictionary to the ARM

The Users page's **Property Dictionary** tab lets the operator administer the Property Dictionary, a set of all the properties that a user can have.

Figure 7-14: Users Page – Property Dictionary tab

After adding a property to the dictionary, you can add it to some or all your LDAP servers. Properties added to an LDAP server will automatically be read from the LDAP server. Properties not added can be set locally in the ARM for each user. The Properties from the dictionary can then be used as User Group conditions as well as in 'Policy Studio'.

> To add / edit a property:

- 1. Open the Property Dictionary page (Users menu > Property Dictionary tab).
- 2. Click Add or Edit.

Figure 7-15: Property

3. Use the following table as reference.

Table 7-5: Add Property

Setting	Description
Name	Define an intuitive name for the property, for intuitive future reference.
Description	Enter a brief description of the property, for intuitive future reference.
Dialable	Defines if this property is a dialable number. Only dialable numbers are used for matching with a received source or destination URI in a route

Setting	Description
	request. Examples of dialable number properties: Office phone number, mobile phone number, Skype number, etc.
Display in Users Table	Select the option to display the user property in the Users page. The option can be used to reduce clutter on the Users page. By default, the option is selected.
Combined attribute	Select this option to configure a new attribute in the Users Dictionary as a combined attribute, i.e., triggered by a combination of two other Users Dictionary attributes. If any of the basic attributes [that the new attribute is combined of] changes, the new attribute will change. In the preceding figure, the new attribute whose name is configured as CombinedNumber will be composed of the existing attributes Office Phone and mobile phone, with the delimiter '_' (not shown in the preceding figure). A change to the value of any of the comprising attributes will trigger a change in CombinedNumber. The combined attribute will automatically be created for each user. SvcCD PWD entrCompCd prodNo authorizationHash intro authorizati

Adding a Users Dictionary Attribute Triggered (Combined) by Two Other Attributes

The ARM provides the capability to add an attribute in the Users Dictionary triggered by a combination of two other Users Dictionary attributes with a predefined delimiter. If any of the basic attributes [that the new attribute is combined of] changes, the new attribute will change. To accomplish this, you must configure the new attribute as Combined attribute.

Figure 7-16: Property - Combined Attribute

[Refer to the example in the figure above] The new attribute whose name is configured as CombinedNumber will be composed of the existing attributes Office Phone and mobile phone, with the delimiter '_' (off-screen in the figure above). A change to the value of any of the comprising attributes will trigger a change in CombinedNumber. The combined attribute will automatically be created for each user.

Figure 7-17: Combined Number

The feature allows a Users Group to be configured for routing based on a combination of other attributes. In addition, the operator can configure rules using one of the combined attributes (phone numbers) with the option to apply post-routing manipulation to remove any unnecessary prefix or suffix from the combined number.

8 Configuring Settings

The Settings page (under the Settings menu) lets you configure

Administration

- License (see Activating Your License on the next page)
- Security (see Securing the ARM on page 101)
- Operators (see Provisioning Operators on page 106)
- Node Credentials (see Node Credentials on page 108)
- Router Credentials (see Router Credentials on page 110)
- Configurator Credentials (see Configurator Credentials on page 112)
- LDAP Authentication (see Provisioning Operators using an LDAP Server on page 115)
- RADIUS Authentication (see Provisioning Operators using a RADIUS Server on page 120)
- Remote Manager (see Remote Manager on page 123)
- Certificates (see Uploading Trusted Certificates on page 103)
- Users (see Adding Registered Users to the ARM on page 124)

Network Services

- Syslogs (see Editing a Syslog Server on page 125)
- NTP server (see Adding/Editing an NTP Server on page 127)
- QoS (see Prioritizing Traffic Per Class of Service on page 129)
- CDR (see Enabling CDRs on page 131)
- Calls (see Disabling, Limiting the Number of CDRs on page 200)

Call Flow Configurations

- Normalization Groups (see Adding a Normalization Group on page 132)
- Prefix Groups (see Adding a Prefix Group on page 134)
- Normalization Before Routing (see Normalization Before Routing on page 137)
- Policy Studio (see Policy Studio on page 138)
- Web Services (see Web-based Services on page 145)

Routing

- Configuring a Quality Based Routing Condition (see Configuring Criteria for a Quality Profile on page 146)
- Configuring a Time-Based Routing Condition (see Configuring a Time-Based Routing Condition on page 148)

- Configuring SIP Alternative Route Reason (see Configuring SIP Alternative Route Reason on page 151)
- Configuring Global Routing Settings (see Configuring Global Routing Settings on page 153)
- Routing Servers
 - Servers
 - Adding a Routing Server (see Adding a Routing Server on page 154)
 - ◆ Editing a Routing Server (see Editing a Routing Server on page 156)
 - ◆ Locking/Unlocking a Routing Server (see Locking/Unlocking a Routing Server on page 158)
 - Groups
 - Adding a Routing Server Group (see Adding a Routing Server Group with Internal and External Priorities on page 158)

Administration Settings

The ARM enables the following administrative tasks to be performed:

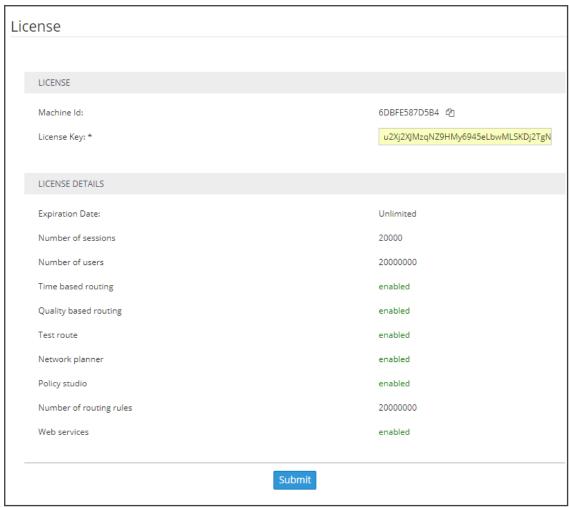

- Configure a software license (see Activating Your License below)
- Manage security (see Securing the ARM on page 101)
- Add an operator (see Provisioning Operators on page 106)

Activating Your License

The ARM must be licensed with a valid license for the product to become fully operational.

- > To activate your license:
- 1. Open the License page (Settings menu > Administration tab License item).

Figure 8-1: License Page

- 2. Select and copy the 'License Key' shown in the figure above.
- Activate the product through the AudioCodes License Activation tool at <u>www.audiocodes.com/swactivation</u>. You'll need your Product Key and the Configurator's Machine ID for the activation process. An email will subsequently be sent to you with your License Key.
- **4.** Copy and paste the License Key string that AudioCodes sends you into the 'License Key' field, and then click **Submit**; the number of sessions purchased and the license expiry date are displayed.
- 5. Make sure the license details (the number of sessions purchased and the license's expiry date) match those that you purchased.

Viewing License Details

License policy is based on the following aspects of ARM functionality and capacity:

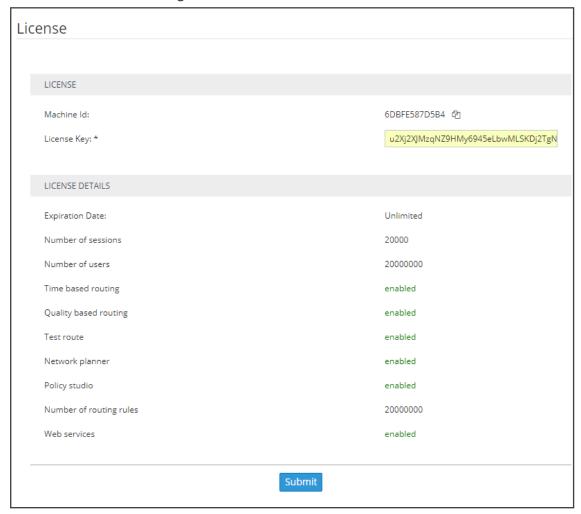

- Expiration Date
- Number of Sessions
- Number of Users

- Number of Routing Rules
- Tune Based Routing (can be either enabled or disabled)
- Quality Based Routing (can be either enabled or disabled)
- Test Route (can be either enabled or disabled)
- Network Planner (can be either enabled or disabled)
- Policy Studio (can be either enabled or disabled)

> To view information about the license applied to your ARM:

Open the License Details page (Settings > Administration > License).

Figure 8-2: License Details

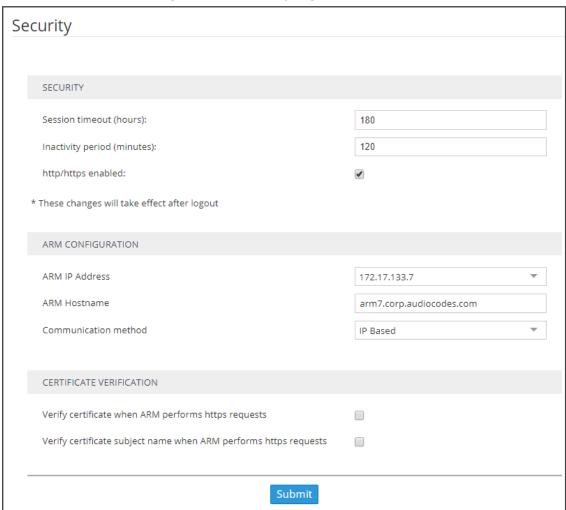

Securing the ARM

This ARM enables operators to secure routing management.

> To secure the ARM:

1. Open the Security page (Settings > Administration > Security).

Figure 9-1: Security Page

2. Use the following table as reference.

Table 9-1: Security Settings

Setting	Description
Session timeout (hours)	Closes the session timeout and forces the user to reenter their password (to reopen the session) if the timeout you define (in hours) expires. Note that this setting only takes effect after logging out and then re-logging in.
Inactivity period	Suspends the user's account if the user does not log in to the ARM over the period you define. 0 disables the feature; users accounts will then never be

Setting	Description
(minutes)	suspended due to inactivity. Note that this setting only takes effect after logging out and then re-logging in.
http/https enabled	Enables an HTTP/HTTPS connection between the ARM server and the SBC / Gateway.

3. See Enabling Client Side Certificate Validation on page 104 and Enabling Certificate Subject Name Verification on page 104 and click **Submit**; the configuration is saved.

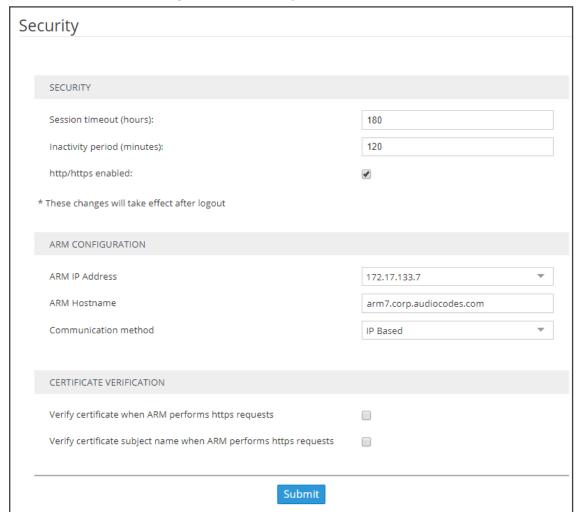

Determining ARM Communications with Other Entities

Operators can determine the way ARM communicates with other entities, e.g., routers and nodes. The ARM Configurator's address configured in these entities can be the Configurator's IP address or Hostname (FQDN).

> To configure the way the ARM communicates with other entities:

1. Open the Security page (Settings > Administration > Security).

Figure 9-2: Security

- 2. Under 'ARM Configuration', configure the:
 - ARM IP Address [Drop-down list of available hard-coded IP addresses that the ARM extracted from the machine's local network interfaces]
 - ARM Hostname [The hostname of the ARM's machine; by default, identical to that of the machine's hostname]
 - Communication method [drop-down list to select whether the ARM should configure its IP address or Hostname (FQDN) for the other entities]

This action may take some time depending on the number of nodes in the network and the number of configured ARM Routers. The action will cause entities to be temporarily disconnected. Peer Connections, VoIP Peers and other entities do not impact on the action.

See also Strengthening Security: Certificate Validation below

Strengthening Security: Certificate Validation

Certificate validation allows stronger ARM communications security. The ARM can validate either the Subject name of the certificate or the entire client certificate that's loaded to the ARM. When initiating TLS communications from the ARM, the ARM will then only accept validated certificates.

Uploading Trusted Certificates

Operators must first upload trusted certificates to the ARM.

To upload trusted certificates:

Open the Add Certificate screen (Settings > Administration > Certificates > Add).

Certificates

SECURITY

Add Refresh

Add Refresh

Arm_sbc22

arm_sbc21

arm_default_router_certificate

CONFIGURATOR
CREDENTIALS

ADD CERTIFICATE

Alias *
Certificate file *

Certificate file *

CERTIFICATES

CERTIFICATES

CERTIFICATES

CERTIFICATES

CERTIFICATES

Figure 9-3: Add Certificate

2. In the 'Alias' field, enter the name of the certificate.

3. Click the browse icon adjacent to the 'Certificate file' field, and then navigate to and select a valid Base64-encoded certificate file.

This setting is system wide; you must upload all certificates for all entities (nodes, ARM routers) communicating over TLS / SSL / HTTPS. The ARM is by default released with the default ARM Router certificate trusted, but if this certificate is changed, you must re-upload the changed certificate.

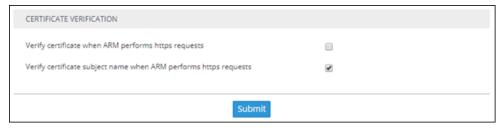

Enabling Certificate Subject Name Verification

The ARM supports capability to validate the subject name received in the server certificate, against the Hostname / IP Address of the entity to which the communication was initiated.

> To enable certificate subject name verification:

- Open the Security page (Settings > Administration > Security) and locate the section 'Certificate Verification'.
- 2. Select the option Verify certificate subject name when ARM performs https requests to enable the feature.

Figure 9-4: Verify certificate subject name when ARM performs https requests

Before enabling the option, make sure all entities communicating over TLS / SSL / HTTPS have a valid certificate with appropriate subject names.

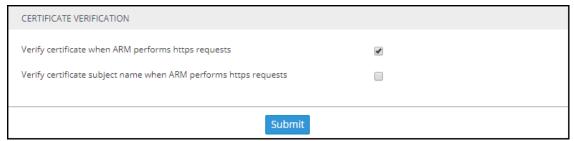

Enabling Client Side Certificate Validation

Operators should only enable validation of certificates after uploading certificates as shown under 'Uploading Trusted Certificates', else the ARM will not be able to communicate with any of the elements which the ARM communicates with over SSL / TLS.

> To enable validation of certificates:

 Open the Security page (Settings > Administration > Security) and locate the section 'Certificate Verification'.

Figure 9-5: Certificate Verification

2. Select the option Verify certificate when ARM performs https requests.

Enhancing SSH Users Management for Security

For security reasons, the ARM blocks remote **root** login into ARM VM Linux machines for both ARM Configurator and ARM Router. The feature prevents accidental damage of ARM system files available for the **root** user. External hackers typically attack the **root** user because the **root** account is the most vulnerable and can be attacked remotely via SSH. Instead of the **root** user, operators can use the **armAdmin** SSH user. During a first-time installation of the ARM or an upgrade to ARM 9.0 or later, this account is created with a default password and the **root** account is blocked for remote access.

The operator can change the default password for an **armAdmin** SSH user. The same password should be shared by all ARM Routers and it can be different to the Configurator's **armAdmin** password.

- > To configure enhanced SSH users management for security:
- Open the Security page (Settings > Administration > Security) and locate section SSH Users.

Figure 9-6: SSH Users

SSH USERS				
Router SSH Credentials				
Username	armAdmin			
Password				
Confirm password				
Configurator SSH Credentials				
Username	armAdmin			
Password				
Confirm password				
The password length must be between 8 and 20. Must contain at least one letter and one digit.				

Starting from ARM 9.0, operators should log in to ARM machines using the **armAdmin** user and to request **root** access only when powerful **root** privileges are required. After a remote login using **armAdmin**, the operator can switch to **root** user by applying the "su-" command. This switch of privileges is required for the following ARM maintenance operations:

- ARM upgrade (starting from ARM V.9.0 and later). Note that upgrade to ARM 9.0 from the customer's previous load still requires root privileges.
- ARM Backup and Restore
- Logs collection (logCollect)

See the ARM Installation Manual for more information.

Provisioning Operators

Operators, i.e., network administrators or IT managers, and operator credentials can be provisioned in four ways:

- Using the ARM's Operators page see Manually Provisioning an Operator in the ARM's Operators Page on the next page
- Using the enterprise's LDAP authentication server see Provisioning Operators using an LDAP Server on page 115
- Using the enterprise's RADIUS authentication server see Provisioning Operators using a RADIUS Server on page 120
- Using the enterprise's Open LDAP authentication server see Authenticating Operator Login using Open LDAP on page 119

If LDAP / RADIUS is used, the order will be:

- LDAP / RADIUS
- Local storage (database)

If an LDAP / RADIUS authentication server is used but it is down or the operator can't be authenticated with it because either the operator isn't found or the password doesn't match, the local operators table is used.

The LDAP / RADIUS method of provisioning operators therefore coexists with the local storage (database) method.

Manually Provisioning an Operator in the ARM's Operators Page

Operators can be manually provisioned using the ARM's Operators Page.

> To manually add an operator:

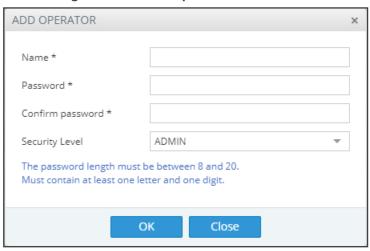

1. Open the Operators page (Settings menu > Administration tab Operators item).

Figure 9-7: Operators

2. Click Add.

Figure 9-8: Add Operator

3. Configure the operator details using the following table as reference.

Table 9-2: Add Operator

Setting	Description
Name	Enter a name for the operator to log in with.

Setting	Description
Password	Enter a password for the operator to log in with.
Password confirm	Confirm the password.
Security Level	Select a Security Level for the operator. An operator with a Security Level of: Security Admin can perform any action, perform provisioning and define a new operator of any permission level. Only Security Admin can make changes to any ARM credentials such as node credentials or ARM Router/Configurator credentials.
	Admin can perform any action and provisioning but cannot define new operators
	Monitor (read-only) cannot perform provisioning or apply any actions

4. Click **OK**; the operator is added to the local ARM database.

Node Credentials

Operators can apply credentials *per Node* for ARM Configurator- Node communications.

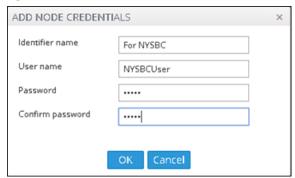

- Only operators whose role is configured as SECURITY_ADMIN can make changes to credentials.
- Before changing the Node's credentials in the ARM Network page, the Web credentials must be updated in the Node itself. See your Node's *User's Manual* for more information.
- > To apply credentials *per Node* for ARM Configurator Node communications:
- 1. Open the Node Credentials page (Settings > Administration > Node Credentials).

Figure 9-9: Node Credentials

2. Click Add.

Figure 9-10: Add Node Credentials

3. Configure the fields using the table as reference.

Table 9-3: Add Node Credentials

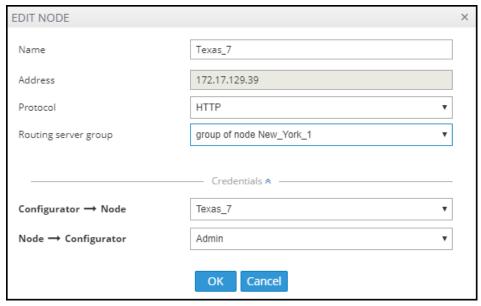

Setting	Description
Identifier name	Enter a name to identify this set of device credentials.
User name	Enter the user name.
Password	Enter the password.
Password confirm	Re-enter the password.

4. Click OK.

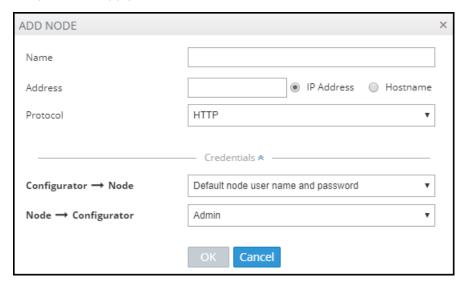

- After adding credentials you can Delete or Edit.
- You can apply one of the previously configured settings to a specific Node (or use the default setting) in the Edit Node screen (Network > Map > <select the specific node> > Edit). Expand the 'Credentials' section first.

Figure 9-11: Edit Node - Credentials - Configurator>Node

5. [Optionally] You can apply the same to 'Add Node' and 'Offline Planner'.

Router Credentials

The operator can change the ARM Routers credentials to be used for ARM Configurator - ARM Routing Server communications.

> To configure new credentials:

1. Open the 'Router Credentials' page (Settings > Administration > Router credentials).

Figure 9-12: Router Credentials

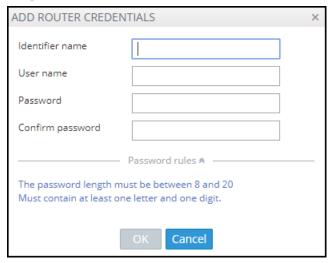

Only operators whose role is configured as SECURITY_ADMIN can make changes to credentials.

2. Click Add.

Figure 9-13: Add Router Credentials

3. Configure the fields using the table as reference.

Table 9-4: Add Router Credentials

Setting	Description
Identifier name	Enter a name to identify this set of router credentials.
User name	Enter the user name.
Password	Enter the password.
Password confirm	Re-enter the password.

- **4.** Click **OK** and then view in the Router Credentials page (shown previously) the new entry for Configurator Router communications of type 'Router'.
- 5. To associate the Routing Server with a specific ARM Router, open the Routing Servers page (Settings > Routing Servers) and then Add or Edit the specific ARM Router. Expand the 'Credentials' section of the screen to do this.

EDIT SERVER router4 Name *

Figure 9-14: Edit Server: Configurator - Router Credentials

× Address * 172.17.133.242 Port 443 Protocol https Advanced Configuration A Configurator - Routing Protocol https Credentials ∧ Configurator → Router Default router user name and password Router → Configurator Router1234561 OK Close

Configurator Credentials

You can configure new ARM Configurator credentials to be used for communications between:

- Node ARM Configurator and
- ARM Router ARM Configurator
- > To configure new credentials:
- 1. Open the Configurator Credentials page (Settings > Administration > Configurator Credentials).

Figure 9-15: Configurator Credentials

Only operators whose role is configured as SECURITY_ADMIN can make changes to credentials.

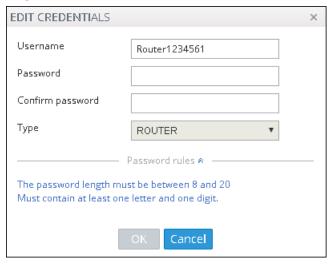

2. Click Add.

Figure 9-16: Add Credentials - Device

- If you're configuring credentials for **Node ARM Configurator** communications, then from the 'Type' drop-down select **Device** as shown in the preceding figure.
- If you're configuring credentials for ARM Router ARM Configurator communications, then from the 'Type' drop-down select Router as shown in the following figure.

Figure 9-17: Add Credentials - Router

3. Configure the fields using the table as reference.

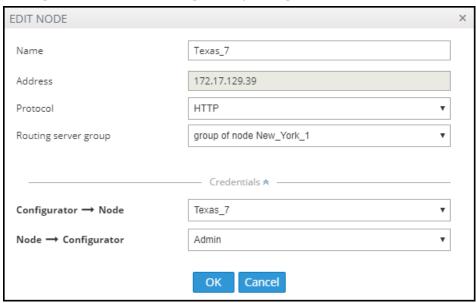

Table 9-5: Add Credentials - Device | Router

Setting	Description
User name	Enter the user name.
Password	Enter the password.
Password confirm	Re-enter the password.

Setting	Description
Туре	If you're configuring credentials for Node - ARM Configurator communications, select Device .
	If you're configuring credentials for ARM Router - ARM Configurator communications, select Router.

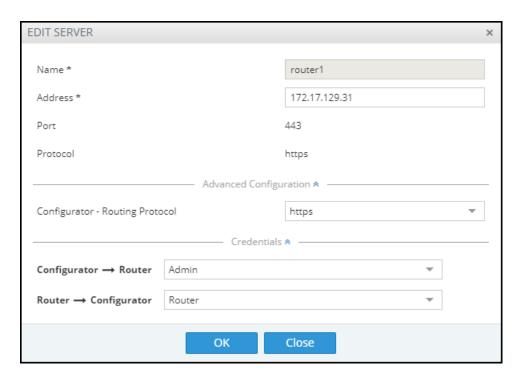

- 4. Click OK.
- 5. [Optionally] Apply one of the previously defined settings to a specific
 - Node (or use the default Node): Open the Edit Node screen (Network > Map > <select the node> > Edit) and expand 'Credentials'.

Figure 9-18: Node - Configurator | Configurator - Node

[The same applies to 'Add Node' and 'Offline Planner']

Router: Open the Routing Servers page (Settings > Routing Servers), click Add or Edit
for the specific ARM Router and then expand 'Credentials'.

After applying newly configured ARM Configurator credentials to a specific Node, view the Node automatically displayed in the 'Configurator credentials' page in the 'Used in Elements' column, shown previously.

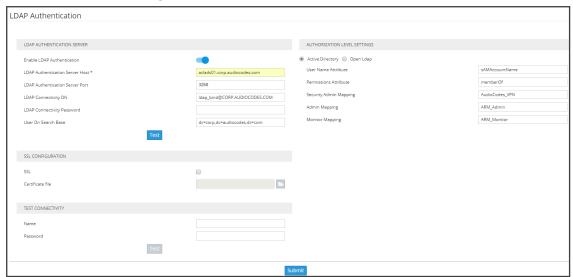

After applying newly configured ARM Configurator credentials to a specific Router, view the Router automatically displayed in the 'Configurator credentials' page in the appropriate 'Used in Elements' column, shown previously.

Provisioning Operators using an LDAP Server

ARM allows using the enterprise's LDAP server for operator login authentication. This feature is in addition to local operator login authentication described under Manually Provisioning an Operator in the ARM's Operators Page on page 107.

- > To add an LDAP operator login authentication server:
- 1. Open the Authentication page (Settings > Administration > LDAP Authentication).

Figure 9-19: LDAP Authentication

Only operators with a security level of Admin can edit LDAP authentication server parameters.

2. Configure the LDAP Authentication Server parameters using the following table as reference.

Table 9-6: LDAP Authentication Server Parameters

Parameter	Description
Enable LDAP Authentication	Select or clear this option to enable or disable operator login authentication using an LDAP-compliant authentication server.
LDAP Authentication Server Host	Enter the IP address of the LDAP server's host.
LDAP Authentication Server Port	Enter the LDAP server's port number. Default: 389
LDAP Connectivity DN	Configure the 'LDAP Connectivity DN' parameter as required.
LDAP Connectivity Password	Configure the 'LDAP Connectivity Password' as required.
User DN Search Base	Configure the 'User DN Search Base' as required.

Parameter	Description
Test	This button tests the LDAP server; it tests whether you can connect to it with the bind user, whether the port is correct, etc.

3. Configure the SSL parameters to secure the connection to the LDAP server, using the following table as reference.

Table 9-7: SSL Parameters

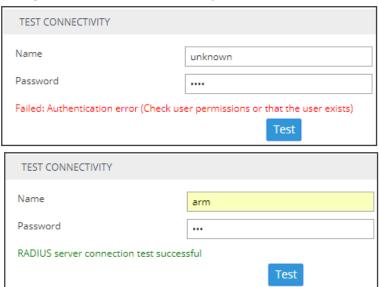

Parameter	Description
SSL	Select the 'SSL' option to secure the connection with the LDAP server over SSL. If left unselected (default), the connection with the LDAP server will be non-secured.
Certificate file	Click the 'Certificate file' browse button to browse to and select the certificate file that you want to use to secure the connection with the LDAP server over SSL. If SSL is selected and a certificate is also selected, an HTTPS connection between the ARM and the LDAP server will be opened. The ARM authenticates the SSL connection using the certificate.

4. Configure the Test Connectivity parameters to test the connection to the LDAP server. Use the following table as reference.

Table 9-8: Test Connectivity

Parameter	Description
Name	If 'Name' is undefined (empty), the connectivity test checks if the LDAP authentication server can be logged into per the values defined under the 'LDAP Authentication Server' parameters.
	If you enter a user name, the connectivity test checks that it's valid for logging into the ARM. Enter the user name assigned to the LDAP server.
Password	If 'Password' is undefined (empty), the connectivity test checks if the LDAP authentication server can be logged into per the values defined under the 'LDAP Authentication Server' parameters.
	If you enter a user password, the connectivity test checks that it's valid for logging into the ARM. Enter the password required for accessing the LDAP server.
Test	This button tests whether the user and the user's password have authorization. If the user matches the mappings on the right side of the screen, it will also 'test' the connection to the server itself.

Figure 9-20: LDAP Connectivity Test Result

- 5. View the result of the LDAP server connectivity test; the figure uppermost shows a failed test while the lowermost figure shows a successful connection.
- 6. Under page section 'Authorization Level Settings', you can provide mapping of the ARM's access rules ('Security Admin' and 'Admin') into the LDAP server's values.

 Use the following table as reference.

Table 9-9: Test Connectivity

Parameter	Description
User Name Attribute	The name of the LDAP-complaint server's directory folder in which the enterprise's user names are located. Default: sAMAccountName. When the operator logs in, the authentication feature checks <i>in this directory</i> <i>folder</i> that the operator's name exists.
Permissions Attribute	The name of the LDAP-complaint server's directory folder in which the permissions are located. Default: memberOf. When the operator logs in, the authentication feature checks <i>in this directory</i> <i>folder</i> if they have permission to log in.
Security Admin Mapping	The name of the LDAP-complaint server's directory folder in which the ARM's access rule is mapped. Default: ARM_SecurityAdmin. When the operator logs in, the authentication feature checks <i>against this directory</i> <i>folder</i> if login is allowed or not.
Admin Mapping	The name of the LDAP-complaint server's directory folder in which the ARM's access rule is mapped. Default: Default: ARM_Admin. When the operator logs in, the authentication feature checks <i>against this directory</i> <i>folder</i> if login is allowed or not.

If LDAP authentication is enabled, the order used to authenticate operator login is:

- LDAP
- Local storage (Database)

If the LDAP server is down or if the operator can't be authenticated with the LDAP server because either the operator isn't found or the password doesn't match, the local operators table is used.

7. Click Submit.

Authenticating Operator Login using Open LDAP

Operator login can optionally be authenticated using Open LDAP.

- > To configure operator login authentication using Open LDAP:
- 1. Open the LDAP Authentication page (Settings > Administration > LDAP Authentication) and then select Open LDAP under 'Authorization Level Settings'.

Figure 9-21: Authenticating Operator Login using Open LDAP

- 2. Configure the LDAP Authentication settings; the settings under 'Open LDAP' are the same as under 'Active Directory'.
 - User Name Attribute [The LDAP attribute used to identify the username]
 - Group Membership Attribute [The LDAP attribute used to list the members of the LDAP group]
 - Security Admin Group Name [The name of the LDAP group containing operators with Admin security level access to ARM]
 - Admin Group Name [The name of the LDAP group containing operators with Admin access to ARM]
 - Monitor Group Name [The name of the LDAP group containing operators with Monitor access to ARM]
 - Group Name Attribute [The LDAP attribute used to identify the LDAP group name]
 - Group ObjectClass Attribute [The value of the ObjectClass attribute that identifies a user group LDAP object]

Figure 9-22: Authorization Level Settings

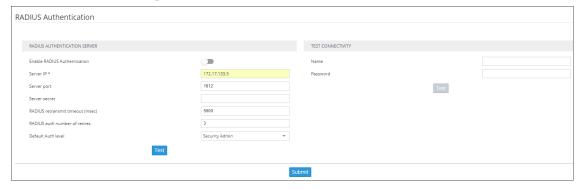

Provisioning Operators using a RADIUS Server

ARM allows using the enterprise's external RADIUS server for operator login authentication. This feature is available in addition to local operator login authentication described under Manually Provisioning an Operator in the ARM's Operators Page on page 107. Only operators with a security level of 'Security_Admin' can edit RADIUS authentication server attributes.

- The default AudioCodes dictionary definition must be used with the RADIUS authentication server for the operator's role definition (same as for the SBC or OVOC).
- Enabling and using both the LDAP server and the RADIUS server for authentication is not allowed.
- > To add a RADIUS operator login authentication server:
- Open the RADIUS Authentication page (Settings > Administration > RADIUS Authentication).

Figure 9-23: RADIUS Authentication

Only operators with a security level of Admin can edit RADIUS authentication server parameters.

Configure the RADIUS Authentication Server parameters using the following table as reference.

Table 9-10: RADIUS Authentication Server Parameters

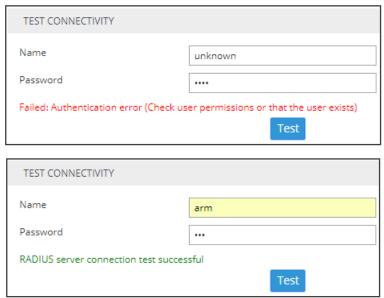

Parameter	Description
Enable RADIUS Authentication	Drag the slider to the 'On' position to enable operator login authentication using a RADIUS authentication server. Default: 'Off' position (disabled).
Server IP	Enter the IP address of the RADIUS authentication server host (in dotted-decimal notation).
Server port	Enter the RADIUS authentication server's port number. Default: 1812
Server secret	Enter the 'secret' for authenticating the RADIUS server: it should be a cryptically strong password. The secret is used by the ARM Configurator to verify authentication of RADIUS messages sent by the RADIUS server (i.e., message integrity). By default, no value is defined.
RADIUS retransmit timeout (msec)	If no response is received from the RADIUS authentication server, the ARM Configurator can be configured to <i>resend packets</i> to it. Enter the time (in milliseconds) the ARM Configurator must wait for the RADIUS server to respond before sending a retransmission.
RADIUS auth num- ber of retries	Enter the maximum number of retransmissions the ARM Configurator performs if no response is received from the RADIUS authentication server.
	Select either:
	Security_Admin [in the SBC / gateway, the equivalent value is 200]
Default Auth level	Admin [mandatory level to edit RADIUS authentication server parameters; in the SBC / gateway, the equivalent value is 100]
	Monitor [user level; in the SBC / gateway, the equivalent value is 50]
	Reject [no permission; in the SBC / gateway, the equivalent value is any other number besides 200, 100 or 50]
Test	Click this Test button to test <i>general connectivity</i> .

3. Connectivity with the RADIUS authentication server can also be tested for *specific credentials* by clicking the **Test** button located under the screen section 'Test Connectivity', after configuring the Test Connectivity parameters described in the following table.

Table 9-11: Test Connectivity for Specific Credentials

Parameter	Description
Name	If 'Name' is undefined (empty), the connectivity test checks if the RADIUS authentication server can be logged into per the values defined under the 'RADIUS Authentication Server' parameters. If you enter a user name, the connectivity test checks that it's valid for logging into the ARM. Enter the user name assigned to the RADIUS server.
Password	If 'Password' is undefined (empty), the connectivity test checks if the RADIUS authentication server can be logged into per the values defined under the 'RADIUS Authentication Server' parameters. If you enter a user password, the connectivity test checks that it's valid for logging into the ARM. Enter the password required for accessing the RADIUS server.

Figure 9-24: RADIUS Connectivity Test Result

4. View the result of the RADIUS server connectivity test; the uppermost figure shows a failed test while the lowermost figure shows a successful connection.

If RADIUS authentication is enabled, the order used to authenticate operator login is:

- RADIUS
- Local storage (Database)

If the RADIUS server is down or if the operator can't be authenticated with the RADIUS server because either the operator isn't found or the password doesn't match, the local operators table is used.

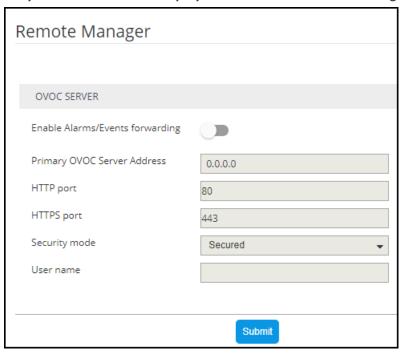

5. Click Submit.

Remote Manager

For ARM status to be indicated in AudioCodes' One Voice Operations Center (OVOC) management platform, ARM-related information such as the IP address of the ARM Configurator, ARM credentials, etc., must be configured in the OVOC (System > Configuration > External Applications > ARM) - see the OVOC User's Manual for more information.

When the OVOC is connected to the ARM, read-only OVOC information is shown in the ARM (Settings > Administration > Remote Manager).

Figure 9-25: Read-Only OVOC Information Displayed in the ARM's Remote Manager Page

ARM-generated alarms and events can be displayed in the OVOC but the feature must be enabled in the ARM (assuming the ARM is already connected to the OVOC).

- > To enable ARM alarms and events reports to be sent to the OVOC:
- In the Remote Manager page (Settings > Administration > Remote Manager) under 'OVOC Server', drag the Enable Alarms/Events forwarding slider to the 'on' position and click Submit.

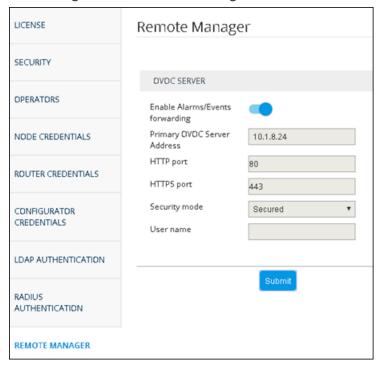

Figure 9-26: Remote Manager

After enabling the feature, the ARM forwards alarms and events to the OVOC allowing operators to receive all the benefits of ARM-sourced alarms and events handling that already exist in the OVOC such as Active Alarms, History Alarms, Carrier Grade Alarms, Alarms Forwarding (via e-mail or syslog).

ARM status (as well as the statuses of other applications) can then be viewed in the OVOC after the ARM updates the OVOC with its status.

See the OVOC User's Manual for more information.

Adding Registered Users to the ARM

SBC registered users can be added to the ARM for the ARM to then be capable of performing call routing based on SBC user registrations. Each SBC has its own registered users. The added SBC registered users and their related information will be viewable in the ARM's Registered Users page shown in Viewing Registered Users in the ARM on page 79. To add registered SBC users to the ARM, operators need to first enable the feature as shown below. After the feature is enabled, the SBC registered users and their related information are taken from the SBC and added to the ARM. Later, when defining a Routing Rule, for example, operators can then route calls to SBC registered users (see Adding a New Routing Rule on page 170). The destination to which to route the call will depend on where - which SBC - the user performed the registration. In the Routing Rule definition, operators will select the appropriate routing condition, namely, that the call destination is an SBC registered user.

To add SBC registered users to the ARM:

Open the Users page (Settings > Administration > Users).

Figure 9-27: Users

2. Make sure the 'Enable registered users feature' option is selected and then click the **Submit** button.

Network Services Settings

The Syslog Server configuration settings can be edited as shown in Editing a Syslog Server below.

An NTP server can be added and its configuration settings edited as shown in Adding/Editing an NTP Server on page 127.

Editing a Syslog Server

The Syslog Server configuration settings can be edited to comply with your requirements.

> To edit a Syslog Server:

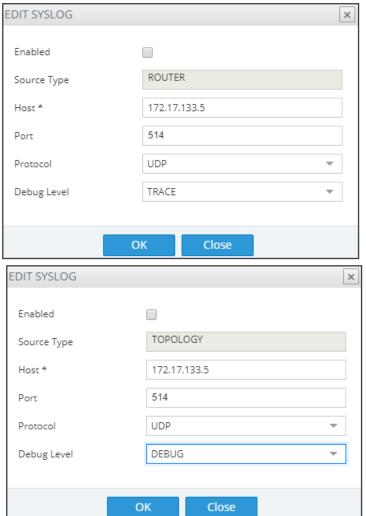

1. Open the Syslogs page (Settings > Network Services > Syslog).

Figure 9-28: Network Services

2. Select the Router or Topology row and then click the enabled **Edit** button.

Figure 9-29: Syslog Details

3. Configure the syslog details using this table as reference.

Table 9-12: Syslog Details

Setting	Description
Host	IP address or host name of the remote syslog server to which messages are sent.
Port	Port of the remote syslog server to which messages are sent.
Protocol	Leave at default (UDP).
Debug Level	From the 'Debug Level' drop-down menu select either: TRACE (default level for the Router; only messages whose debug level is TRACE are sent to the syslog server) DEBUG (default level for Topology; only messages whose debug level is
	DEBUG and higher are sent to the syslog server)

When enabling syslog for a Router, there's a single syslog server for all Routing servers in the ARM. All ARM Routers send their syslog to this syslog server (at the same 'Debug Level'). This is necessary for proper calls debugging, as a single call can be processed by several different ARM Routers (they are state-less). For the ARM Configurator, however, you can assign a different syslog server.

Adding/Editing an NTP Server

An NTP server can be added and its configuration settings edited.

> To add an NTP server:

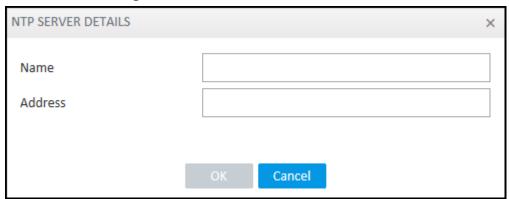

1. Open the NTP Servers page (Settings menu > Network Services tab > NTP Servers item).

Figure 9-30: NTP Servers

2. Click Add.

Figure 9-31: NTP Server Details

3. Configure the NTP server details using the following table as reference. The same details open when editing the server.

Table 9-13: NTP Server Details

Setting	Description
Name	Enter a name for the NTP server.
Address	Enter the IP address or host name of the NTP server.

4. Click OK.

Prioritizing Traffic Per Class of Service

The ARM supports Differentiated Services (DiffServ) protocol for specifying and controlling network traffic by class, so that certain types of traffic get priority over others.

DiffServ uses a 6-bit differentiated services code point (DSCP) in the 8-bit differentiated services field (DS field) in the IP header for packet classification purposes.

The ARM lets you configure the DSCP value for outgoing packets coming from the ARM Configurator and from the ARM Routers. Different values for Gold, Silver and Bronze can be configured. The following table shows how protocols are mapped to class of service.

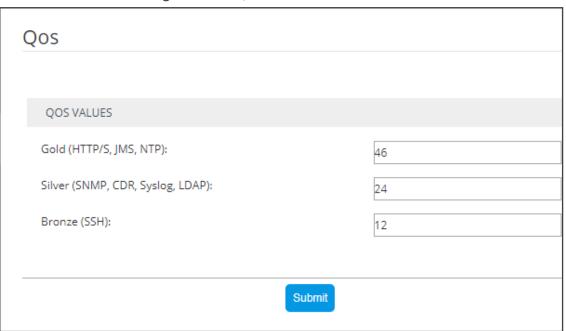

Table 10-1: Protocols Mapped to Class of Service

Application Protocol	Class of Service (Priority)	Traffic Type
HTTP/HTTPs	Gold	 Signaling/Control Communication between node and ARM Configurator, node and ARM Configurators Some communication between ARM Routers and ARM Configurator
JMS	Gold	Management affecting signaling. Critical communication between ARM Configurator and ARM Routers.
NTP	Gold	Control and Management
SNMP	Silver	Management (SNMP traps)
CDRs and Syslog	Silver	Management
LDAP	Silver	Management (for ARM users)
SSH	Bronze	Management

> To configure the feature:

1. Open the QoS page (Settings > Network Services > QOS).

Figure 10-1: QoS

2. Configure QoS values using this table as reference.

Table 10-2: QoS Settings

Setting	Description
Gold	[Application protocol: HTTP/S, JMS, NTP] You can change the default value of 46 to suit the requirements of your IP network. As part of IP network planning and optimization, the value can be changed to a value in the range between 0-63. The value determines priority of IP packets related to 'Gold' service.
Silver	[Application protocol: SNMP, CDR, Syslog, LDAP] You can change the default value of 24 to suit the requirements of your IP network. As part of IP network planning and optimization, the value can be changed to a value in the range between 0-63. The value determines priority of IP packets related to 'Silver' service.
Bronze	[Application protocol: SSH] You can change the default value of 12 to suit the requirements of your IP network. As part of IP network planning and optimization, the value can be changed to a value in the range between 0-63. The value determines priority of IP packets related to 'Bronze' service.

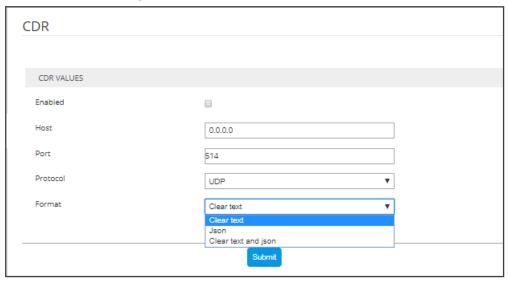

Enabling CDRs

The ARM allows you to enable Call Detail Records (CDRs) containing information on all calls routed by the ARM, including source and destination users, call duration and the call path. CDRs are sent as Syslog packets to a server IP address that you need to configure.

> To enable CDRs:

1. Open the CDR page (Settings > Network Services > CDR).

Figure 10-2: CDR

2. Configure the parameters using the following table as reference.

Table 10-3: CDR Parameters

Setting	Description
Enabled	Select or clear the option to enable or disable CDRs.
Host	Enter the IP address of the server.
Port	Enter the server port.
Protocol	From the drop-down menu, select UDP (default) or TCP over which the CDRs will be sent.
Format	From the drop-down menu, select a format. You can select to have CDRs in clear text, JSON format, or in both.

Call Flow Configurations

The ARM's **Call Flow Configurations** tab under the Settings menu allows operators to configure

- Normalization Groups (see Adding a Normalization Group below)
- Prefix Groups (see Adding a Prefix Group on page 134)
- Normalization before Routing (see Normalization Before Routing on page 137)
- Policy Studio (see Policy Studio on page 138)
- Web Services (see Web-based Services on page 145)

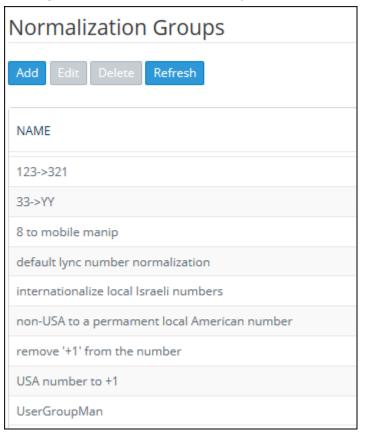

Adding a Normalization Group

You can add a Normalization Group. A Normalization Group can comprise one rule or multiple rules. If there are multiple rules in a group, manipulation is performed in the order the rules are listed. The output of the first rule will be the input of the next.

> To add a Normalization Group:

 Open the Normalization Groups page (Settings menu > Call Flow Configurations tab > Normalization Groups).

Figure 10-3: Normalization Groups

2. Click Add.

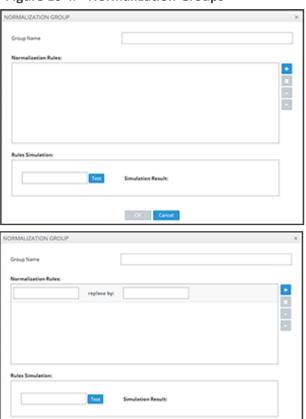

Figure 10-4: Normalization Groups

3. Use the following table as reference.

Table 10-4: Normalization Groups

Setting	Description	
Group Name	Enter a Group Name for intuitive future reference.	
Normalization Rules	 Click the + button adjacent to the pane as shown in the figure above. In the left textbox, enter a regular expression. For more information about regular expressions, refer to online tutorials or see Examples of Normalization Rules on page 230. 	
	3. In the replace by field, enter the text that will replace the found regex. You can use groups collected by brackets () in the regex in the replacement string using \$1, \$2, See a regex tutorial for more information.	
Rules Simulation: Test	Use the rules simulation to test different possible inputs and verify that the regex sequence you entered produces the result you intended. Enter any value you want to test and click Test; the result of each individual rule is displayed to the right; the result of all the rules together is displayed lowermost right.	

After a Normalization Group is defined, you can attach it to a:

- Peer connection (see Peer Connection Information and Actions on page 36).
- Globally (see Normalization Before Routing on page 137)
- Routing Rule action (see Adding a New Routing Rule on page 170)
- LDAP attribute (see Adding an LDAP Server to the ARM on page 87)

The same Normalization Group can be reused/attached several times in any of the above cases.

Using Prefix Groups

Prefix Groups make routing management and Dial Plan management easier, more efficient and more convenient for telephony network operators. The feature also makes it possible to import an existing customer's Dial Plan into the ARM using the northbound REST API.

Every routing rule can have dozens of prefixes. Grouping prefixes and then associating groups with routing rules reduces visual complexity and allows for more effective management. Prefix Groups save operators from repeatedly having to add prefixes to rules.

Once defined, the Prefix Group comprising multiple prefixes is associated with a routing rule (see Adding a New Routing Rule on page 170 for information on how define a routing rule). If, for example, an enterprise has distributed offices, the following can be defined: If a caller calls from source prefix x, the call is sent from SBC 1; if a caller calls from source prefix 2, the call is sent from SBC 2.

To develop a customer-specific Dial Plan into an ARM Prefix Group, the REST API is available. This can significantly facilitate ARM provisioning.

Adding a Prefix Group

The ARM GUI conveniently allows the network telephony operator to add a Prefix Group.

> To add a Prefix Group:

 Open the Prefix Groups page (Settings menu > Call Flow Configurations tab > Prefix Groups item).

Figure 10-5: Prefix Groups

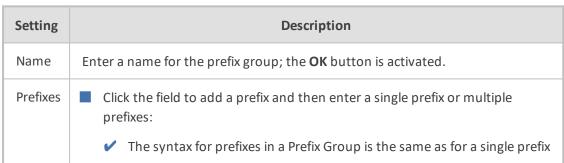

2. Click the Add button.

Figure 10-6: Add Prefix Group

3. Define a Prefix Group using the following table as reference.

Table 10-5: Add Prefix Group

Setting	Description	
	in a Routing Rule (see Prefixes on page 229 for more information).	
	Multiple prefixes can be copied from an external file and pasted into this field.	
	Using the 'Copy to clipboard' feature, you can copy multiple existing prefixes in this field to the clipboard and then paste into an external file where you can view (for example) all prefix strings at once or count (for example) how many prefixes exist in the group.	

- 4. Click **OK**; the Prefixes Group is created.
 - Associate the group with a rule's condition in the Routing page
 - The group can be associated with Source, Destination or both

Searching for a Prefix Group

The telephony network may include dozens of prefix groups and multiple prefixes within each group. The 'Enter search string' field in the Prefix Groups page allows the operator to quickly locate a group. After locating a group, the operator can view it and/or edit it.

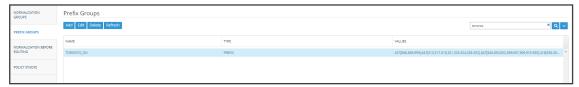

Searching for a Specific Prefix within a Prefix Group

After locating a group in the Prefix Groups page using the 'Enter search string' field (for example), the operator can conveniently search in that group for a specific prefix (string).

> To search for a specific prefix in a group:

1. In the Prefix Groups page, select the group to search in.

Figure 10-7: Prefix Groups Page

2. Click the activated **Edit** button.

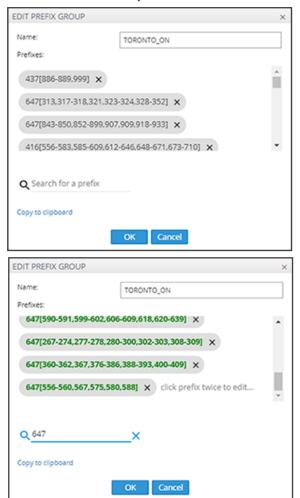

Figure 10-8: Edit Prefix Group - Search for a Prefix

3. In the 'Search for a prefix' field, enter the string to search for and then press Enter; the results are presented in **bold**.

Editing a Specific Prefix within a Prefix Group

After locating the Prefix Group and then the specific prefix within that group to edit, click the prefix twice and edit per requirements. The syntax for prefixes in a Prefix Group is the same as for a single prefix in a Routing Rule (see Prefixes on page 229 for more information).

Normalization Before Routing

A normalization rules group can be applied to a routing request's source user part and to a routing request's destination user part. See Adding a Normalization Group on page 132 for information on how to add a normalization rules group.

When the ARM receives a routing request, it normalizes the routing request's source user part with the chosen Normalization Group, and the routing request's destination user part with the chosen Normalization Group.

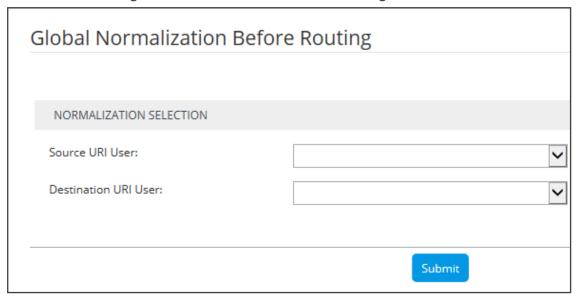

'Global Normalization Before Routing' parameters configured in this page are used globally for the entire network as pre-routing normalization. This global normalization can be overwritten

at a Peer Connection level with other Normalization Rules if required (see under Peer Connection Information and Actions on page 36).

> To attach a normalization rules group globally before routing:

 Open the Normalization Before Routing page (Settings menu > Call Flow Configurations tab > Normalization Before Routing item).

Figure 10-9: Normalization Before Routing

2. Use the following table as reference.

Table 10-6: Normalization Before Routing

Setting	Description
Source URI User	From the drop-down menu, select the normalization rules group. This will be the normalization on the Source URI User field.
Destination URI User	From the drop-down menu, select the normalization rules group. This will be the normalization on the Destination URI User field.

3. Click Submit.

Policy Studio

This feature allows adding information to route requests that is not contained in the route requests but is taken from the user table. To accomplish this with legacy products without ARM, the LDAP server must be queried for every call using complex query rules, creating delays and straining the server. In the ARM, the user table is loaded to memory and information gathering is handled internally in real time. Policy Studio Use Examples:

Each user has an internal 4-digit extension and an unrelated external phone number. When a user makes a call outside the enterprise, the source number, i.e., the user's

extension, must be replaced with their external number. When a call comes in from outside, the external number must be replaced with the user's extension.

Same as the previous example but, in addition, there can be more than one user with the same extension, and what differentiates them is their hostname. The ARM can locate the user based on a combination of the extension and hostname attributes.

Policy Studio is a set of rules. Each rule contains a match condition and an action. The match condition is a set of route request fields to be compared, and a set of user properties to be compared to. The match condition also has a source node or Peer Connection or set of source nodes or Peer Connections. The action is a set of route request or response fields to be replaced, and a set of user fields to replace them with. For every route request received, the ARM processes all the rules from top to bottom. For each, the ARM searches in the users table for a user that matches all the fields. If a user is not found, the ARM proceeds to the next rule. If a user is found, the ARM stops parsing the rules and performs the action in this rule. The action is to replace all the listed fields with the properties of the user, as configured.

> To add a Policy Studio rule:

 Open the Policy Studio page (Settings menu > Call Flow Configurations tab > Policy Studio item).

Figure 10-10: Policy Studio

Click Add.

Figure 10-11: Add Call Item - User (default)

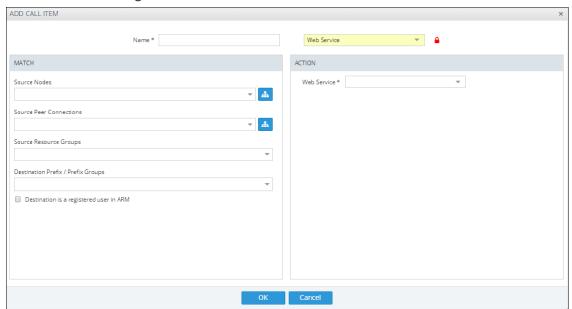

Figure 10-12: Add Call Item - Web Service

3. Configure the settings using the following table as reference.

Table 10-7: Policy Studio Settings

Setting	Description	
Name	Defines the name of the Policy Studio rule to add, to facilitate management of the feature.	
User / Web Service	 Policy Studio supports two uses, as shown in the preceding two figures: User (default). Select this option to use Policy Studio based on information taken from ARM Users Data. Web Service. Select this option to use an external web service for pre-routing manipulation. See also Webbased Services on page 145. 	
МАТСН	The set of match conditions for finding a user from the Users table. Click + to add more conditions.	
Source Nodes	From the drop-down, select a Node or set of Nodes for which this rule will be used. Alternatively, click the adjacent button to select a Node or set of Nodes from the Topology Map. If left empty, the rule is used regardless of the origin of the call. Note: To select multiple elements in the Choose Topology Item screen, press Ctrl and click the elements.	
Source Peer Connections	Select a Peer Connection or set of Peer Connections for	

Setting	Description
	which this rule will be used. Alternatively, click the adjacent button to select a Peer Connection or set of Peer Connections from the Topology Map. If left empty, the rule is used regardless of the origin of the call. Note: To select multiple elements in the Choose Topology Item screen, press Ctrl and click the elements.
Source Resource Groups	Select a set of Nodes or a set of Peer Connections for which this rule will be used. If left empty, the rule is used regardless of the origin of the call.
Destination Prefix / Prefix Groups	[Optionally] Add an additional condition for users' information-based pre-routing.
Destination is a registered user in ARM	If this option is selected, the Policy Studio rule will be matched <i>only</i> if the destination number is a registered user's number (listed in the Registered Users table).
SIP Header	Select a route REQUEST field from the following available fields (this is a field from the route REQUEST that is compared with the user properties):
	SOURCE_URI_USER (default)
	SOURCE_URI_HOST
	■ DEST_URI_USER
	■ DEST_URI_HOST
	CONTACT_URI_USER
	■ CONTACT_URI_HOST
	■ CONTACT_URI_PORT
	P_ASSERTED_IDENTITY_DISPLAY_NAME
	P_ASSERTED_IDENTITY_USER
	P_ASSERTED_IDENTITY_HOST
	If a call matches the selected criterion, the manipulative action you select will be performed. For a SIP field manipulation example, see Example 2 under Example 2 of a Policy Studio Rule on page 144.
ACTION	The set of replacement actions that will be performed on

Setting	Description
	the route request and route response fields for a found user.
Action field	Select a route request or route response field from the following available fields (when a user is found, this field will be replaced with the value of the configured user properties):
	SOURCE_URI_USER
	SOURCE_URI_HOST
	■ DEST_URI_USER
	■ DEST_URI_HOST
	■ DEST_IP_ADDR
	■ DEST_PORT
	■ DEST_PROTOCOL
	■ USER_CREDENTIALS_USER_NAME
	■ USER_CREDENTIALS_PASSWORD
	P_ASSERTED_IDENTITY_DISPLAY_NAME
	P_ASSERTED_IDENTITY_USER
	P_ASSERTED_IDENTITY_HOST
	Multiple actions can be defined. Click + to define another action.
	Note : If either USER_CREDENTIALS_USER_NAME <i>or</i> USER_CREDENTIALS_PASSWORD is used in an action, you must add <i>both</i> .
	For a SIP field manipulation example, see Example 2 under Example 2 of a Policy Studio Rule on page 144.
Request User Property	Select a set of user properties. The request field is compared to these properties of the users. If any of the properties of a user is equal to the value of the field, then this condition is considered a match.
Replacement User Property	Select a set of user properties. The action is to replace the value in the request or response field with the value of this user property. If the found user has no value for this property, then no action is done on this field. If there more than one property is listed here, then ARM replaces

Setting	Description
	the field with the first property if the user has it. If the user does not have it, ARM proceeds to the next property in the list, in the configured order.

Fields such as 'Source Nodes' and 'Source Peer Connections' in Policy Studio's Add Call Item screen and Edit Call Item screen feature filters in which network administrators can select multiple elements and then *invert the selection*. The feature improves usability and user experience especially in large networks with high numbers of elements. The feature allows network administrators to

- Select a single element
- Delete a single element (x)
- Select All elements
- Clear all selected elements
- Select All and delete a few (x)
- Select All, delete a few (x) and then invert the selection; the elements deleted will be in the selection
- Select a few elements and then invert the selection; only elements that weren't selected will be in the selection
- Clear a selection

Example 1 of a Policy Studio Rule

Refer to the defined Policy Studio rule shown in the figure depicting the Call Item Settings screen:

- For every route request coming from node New_York_1, the ARM will search for a user whose office phone property is equal to the value of the SOURCE_URI_USER field.
- ARM will then replace the SOURCE_URI_USER field with the value of the found user's External Number property.

EDIT CALL ITEM Name * Replace extension with external number MATCH ACTION Source Nodes SOURCE_URI_USER ▼ External Number New_York_1 🗶 Source Peer Connections ~ <u>*</u> Source Resource Groups Destination Prefix / Prefix Groups Destination is a registered user in ARM SOURCE_URI_USER ▼ Office Phone Cancel

Figure 10-13: Policy Studio Rule Example 1

Example 2 of a Policy Studio Rule

The ARM's Policy Studio Rule allows you to manipulate a rule to provide Location Based Emergency calls routing in a CCE environment with ARM capabilities. Refer to the defined Policy Studio Rule shown in the following figure.

ADD CALL ITEM Name Local Emergency numbers MATCH ACTION Source Paris_2 🗙 Nodes/Pcons P_ASSERTED_IDENTITY_DISPLAY_NAI ▼ branch IP address DEST URI USER branch emergency nu... DEST URI USER emergency short dial P_ASSERTED_IDENTITY_USER company site main nu.. P_ASSERTED_IDENTITY_DISPLAY_NAI ▼ + 🛍

Figure 10-14: Policy Studio Rule Example 2

In the rule above.

- The node sends a route request to the ARM. The request includes the two fields under MATCH and the values configured for them; if one and/or the other exists and their values are those configured, then the manipulations configured under ACTION will be used in response to the route request:
 - DEST_URI_USER will be replaced by branch emergency number
 - P-ASSERTED_IDENTITY_USER will be replaced by *company site main number*
 - P-ASSERTED_IDENTITY_DISPLAY_NAME will be replaced by empty column

Web-based Services

The ARM supports number portability solutions for querying an external source for additional information about each call. It also provides a general infrastructure for any future Web-based service that can impact ARM call routing. The prominent example is to query a number portability server that contains a database of every phone number in the country, and the actual carrier network that it currently belongs to.

- The feature is invisible in the ARM unless enabled in the License Key.
- The feature can conform to any protocol or design using a plug-in which AudioCodes will provide per the protocol required by the customer.

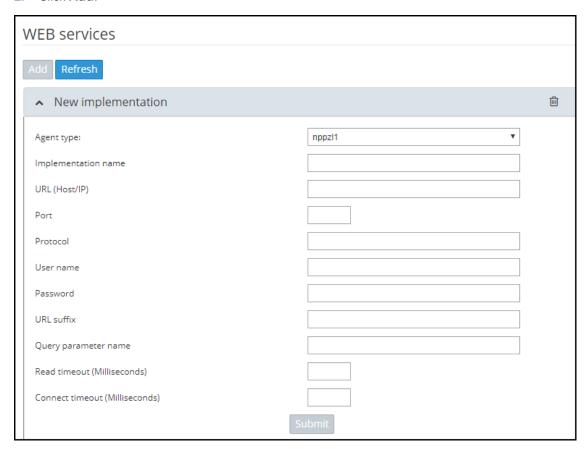

> To configure a Web service:

1. Open the Web Services page (Settings > Call Flow Configurations > Web Services)

Figure 10-15: Web Services

2. Click Add.

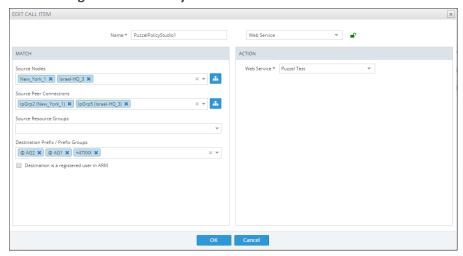

3. Configure the Web service you require in the New Implementation screen.

Parameters in the screen are *per customer* and therefore differ from one customer to the next. Contact your AudioCodes representative if necessary for clarifications.

- 4. Click Submit.
- Apply the service: Open the Policy Studio (Settings > Call Flow Configurations > Policy Studio) and click Add. See also Policy Studio on page 138.

Figure 10-16: Policy Studio - Add Call Item

- **6.** Select number portability as shown in the preceding figure. The default is **User** to preserve the existing functionality of Policy Studio.
- 7. Policy Studio can be applied to a specific condition (see under MATCH in the preceding figure):
 - Source Nodes and / or Peer Connections and / or Source Resource groups
 - Destination Prefix and / or Prefix groups
 - Applicable for ARM registered users

Routing Settings

Configuring Criteria for a Quality Profile

You can configure criteria for a quality profile for bad, fair or good call paths based on the calculation of MOS and ASR. You can configure a specific Peer Connection to exclude either the MOS or the ASR criterion (see Peer Connection Information and Actions on page 36). After enabling 'Use Quality Based Routing' (see the following figure), the quality status of Peer Connections and Connections will be displayed in the network map's Quality Layer. The configured quality profile can be associated with a Routing Rule (see Adding a New Routing Rule on page 170) which will be applied only if all Peer Connections and Connections in the route meet the criteria.

The quality of voice on a line is calculated based on the quality of voice measured in multiple calls over a period. The ARM issues alarm indications for quality change.

> To configure a quality based routing condition:

 Open the Advanced Conditions screen (Settings > Routing > Quality Based Routing). By default, Use Quality Based Routing is selected. If it isn't, select it.

Figure 10-17: Configuring Criteria for a Quality Profile

2. Activate either MOS, ASR or both and then configure criteria by dragging the range indicators to the lower and upper limit you require. Use the following table as reference.

Table 10-8: Configuring Criteria for a Quality Profile

Quality Condition	Description
MOS (Mean Opinion Score)	Specified by ITU-T Recommendation P.800, MOS is the average grade on a quality scale of Good to Failed, given to voice calls made over a VoIP network, after testing. MOS-LQ = listening quality, i.e., the quality of audio for listening purposes; it
	doesn't take bi-directional effects, such as delay and echo into account. MOS-CQ = conversational quality; it takes listening quality in both directions into account, as well as the bi-directional effects.
ASR (Answer- Seizure Ratio)	Measurement of network quality and rate of successful calls. % of answered calls relative to the total call volume.

3. Click **Submit**; a quality profile is generated which you can associate with a Routing Rule (see Adding a New Routing Rule on page 170).

Configuring a Time-Based Routing Condition

The time-based routing feature allows you to configure a routing rule activated only at the time specified in a time condition. You can configure a condition and then associate it with a routing group or a routing rule, or both (see Adding a New Routing Rule on page 170 under 'Advanced Conditions').

> To configure a time-based routing condition:

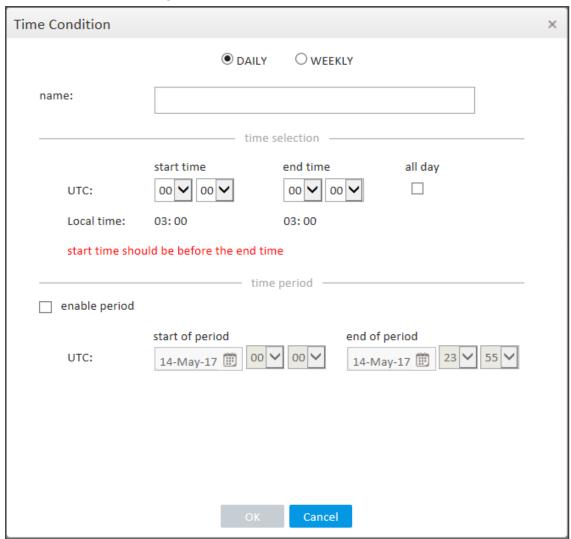

1. Open the Time-Based Routing screen (Settings > Routing > Time Based Routing).

Figure 10-18: Time Based Routing

2. Add a time-based routing condition: Click **Add**; the Time Condition screen is displayed.

TIME CONDITION name: Week-ends (Israel) time selection TUE WED SUN MON THU FRI SAT enable monday start time end time all day ✓ UTC: 00 ~ Local time: 03:00 03:00 time period enable period start of period end of period UTC: 00 ~ 00 ~ 23 🗸 55 🗸 02-Jul-17 02-Jul-17

Figure 10-20: Time Condition - Example

3. Configure a time-based routing condition. Use the following table as reference. See the preceding figure for an example.

Table 10-9: Time Condition

Time Condition	Description
Daily/Weekly	Select either Daily or Weekly.
	Daily - This is a daily recurring period.
	Weekly - This is a period recurring on given days of the week.
	The figure above shows a configured weekly condition. Green 'day' button: activated on that day. Blue 'day' button: selected to configure it.
Name	Enter an intuitive name to later easily identify the condition when applying it.

Time Condition	Description
Start time	From the drop-downs, select the hour and the minutes past the hour. The times are configured in UTC (Coordinated Universal Time).
End time	From the drop-downs, select the hour and the minutes past the hour
All day	Select this option to base the routing condition on the entire day.
Enable period	Select this option to base the routing condition on a period.
Start of period	From the calendar icon, select the date on which the period will start. From the drop-downs, select the hour and the minutes past the hour.
End of period	From the calendar icon, select the date on which the period will end. From the drop-downs, select the hour and the minutes past the hour.

4. Click OK; a profile is generated which you can associate with a Routing Rule (see Adding a New Routing Rule on page 170 under 'Advanced Conditions'). Also, you can associate the configured time condition with a Routing Group. In this case, it will apply to all Routing Rules in the Group. Note that the same time condition profile can be reused multiple times.

Configuring SIP Alternative Route Reason

The ARM operator can configure SIP responses in the SIP Alternative Route Reason page, which will cause the ARM to apply alternative routing paths if available.

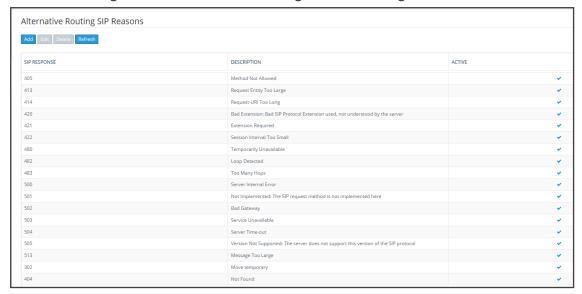

If a call fails and the SIP response received from the remote side is not configured in the SIP Alternative Route Reason page, the ARM will not apply an alternative route for the call.

The page allows operators to change the default ARM behavior for an Alternative Routing decision.

➤ To configure a SIP Alternative Route Reason:

 Open the Alternative Routing SIP Reasons page (Settings > Routing > Alternative Routing SIP Reasons).

Figure 10-21: Alternative Routing SIP Reasons Page

Click the Add tab.

Figure 10-22: Adding an Alternative Routing SIP Reason

- 3. Enter the SIP Response number (200-600).
- 4. Provide a description of the reason.
- 5. Select the **Active** option to activate the configuration.
- 6. Click the now-enabled **OK** button.

> To edit a SIP Alternative Route Reason:

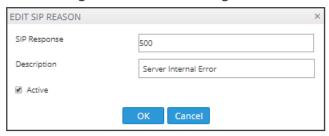

1. In the Alternative Routing SIP Reasons screen, select the SIP response to edit.

SIP responses are listed in numerical order. You can browse to the next page or to the last page of responses. You can browse to the page before the page you are on, if you're not on the first page, or you can browse to the first page.

2. Click Edit.

Figure 10-23: Editing an Alternative Routing SIP Reason

3. Edit per your requirements and click OK.

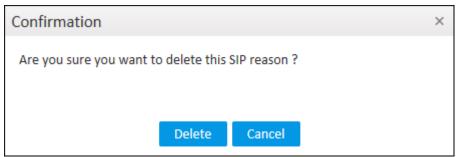

By clearing the 'Active' option, the operator can 'deactivate' a SIP reason without deleting its row in the table. If a SIP reason is 'deactivated', the ARM will not apply an alternative route. The ARM will function as if there is no row at all. The 'deactivated' row, however, remains in the table, and if the operator re-decides, it can be 'reactivated' by selecting the 'Active' option.

> To delete a SIP Alternative Route Reason:

1. In the Alternative Routing SIP Reasons screen, select the SIP response to delete.

Figure 10-24: Deleting an Alternative Routing SIP Reason

2. Click Delete.

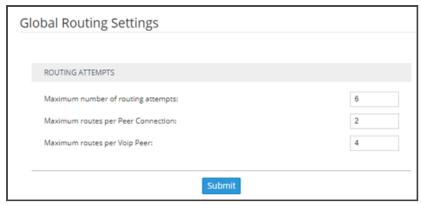

Configuring Global Routing Settings

The ARM enables global routing settings to be configured.

> To configure global routing settings:

Open the Global Routing Settings page (Settings menu > Routing tab > Routing Settings item).

Figure 10-25: Global Routing Settings

2. Configure the parameters using the following table as reference.

Table 10-10:Routing Attempts

Setting	Description	
Maximum number of Routing Attempts	Defines the maximum number of routing attempts per call. If the maximum number of routing attempts has not yet been reached, the ARM searches for an alternative routing possibility for the specific call.	
Maximum number of routing attempts per Peer Connection	Defines the maximum number of routing attempts per Peer Connection. If the maximum number of routing attempts has not yet been reached, the ARM tries to re-route the call to a preferable Peer Connection. Default: 2 attempts.	
Maximum Number of Routing Attempts per VoIP Peer	Allows operators to determine the maximum number of routing attempts per VoIP Peer for a specific call. Default: 4.	

3. Click Submit.

Adding a Routing Server

A Routing Server can be added to the ARM for handling calls coming from SBCs and Gateways.

- ARM Version 8.4 supports up to 40 Routing Servers a necessary feature in very large ARM deployments of almost unlimited scale.
- ARM Version 8.2 and earlier supported up to 10 ARM Routing Servers.
- In average size deployments, an ARM Routing Server can be deployed close to each Node (or small group of Nodes), providing additional Node Survivability. If a

network disconnection occurs, a Node's Routing requests are then served by the adjacent, almost co-existing Routing Server.

If a very high number of Routing Servers is used for survivability purposes, it's
recommended to apply the 'Sticky primary' routing policy for a Node (see under
Node Information and Actions on page 26 for more information) and to provide the
adjacent Routing Server as the priority for handling the Node's routing requests.

> To add a Routing Server to the ARM:

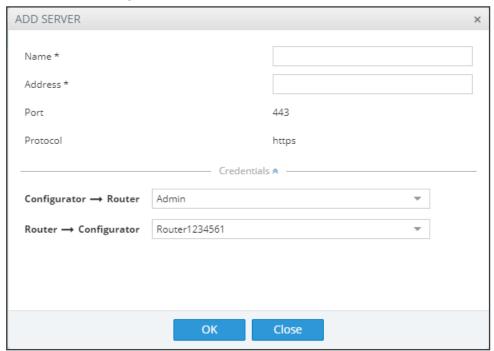

Open the Routing Servers page (Settings > Routing Servers).

Figure 10-26: Routing Servers

2. Click Add.

Figure 10-27: Server Details

Adding a Routing Server without adding it to a Routing Server Group will have no effect as Routing Servers are as of ARM Version 8.6 not attached directly to nodes (see under Adding a Routing Servers Group with Internal and External Priorities).

3. Configure the routing server using the following table as reference.

Table 10-11:Routing Server Details

Setting	Description
Name	Enter a name for the ARM Router (routing server).
Address	Enter the IP address or host name for the ARM Router (routing server).
Port	[Read only] ARM Router (routing server) port number. Default: 443
Protocol	[Read only] HTTPS
Credentials	Allows you to specify the credentials which the Configurator will use to communicate with the router and vice versa.

4. Click **OK**; the routing server is added.

Editing a Routing Server

After a routing server is added to the ARM, its configuration can be edited if necessary.

> To edit a Routing Server:

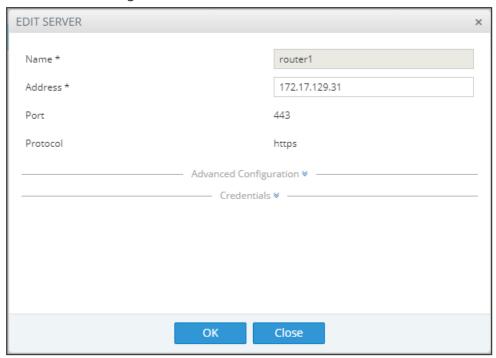

1. Open the Routing Servers page (Settings > Routing Servers).

Figure 10-28: Routing Servers

2. Select the row of the routing server to edit, and then click **Edit**.

Figure 10-29: Edit Server

3. Edit the server using the following table as reference.

Table 10-12:Edit Server

Setting	Description	
Name	[Read-only] The name of the ARM Router (routing server).	
Address	Enter the IP address or host name for the ARM Router (routing server).	
Port	[Read only] ARM Router (routing server) port number. Default: 443.	
Protocol	[Read only] HTTPS	
Nodes	[Read only] The Nodes (SBCs or Gateways) to which the router was added.	
Advanced Configuration		
Configurator – Routing Protocol	To display this parameter, click ➤ adjacent to Advanced Configuration and then from the parameter's drop-down menu, select the protocol between the Configurator and the Router (HTTP or HTTPS). Default: HTTPS. HTTP can temporarily be used for debugging purposes.	
Credentials		
Configurator > Router	To display this parameter, click ♥ adjacent to Credentials. Allows you to specify the credentials which the Configurator will use to communicate with the router.	

Setting	Description
Router > Configurator	To display this parameter, click ♥ adjacent to Credentials. Allows you to specify the credentials which the router will use to communicate with the Configurator.

Locking/Unlocking a Routing Server

The ARM allows users to lock routing servers, for troubleshooting or maintenance purposes. Locking a routing server causes the devices to disconnect from the locked routing server, causing all traffic to divert to the other unlocked and available servers. Unlocking a routing server causes the devices to reconnect, and makes the routing server fully functional.

A locked routing server can also be associated with ARM Nodes without participation in calls routing. This can be useful during the preparation phase for network setup.

➤ To lock or unlock a Routing Server:

1. Open the Routing Servers page (Settings > Routing Servers).

Figure 10-30: Routing Servers - Administrative State

2. Determine from the icon under the 'Administrative State' column whether a routing server is locked or unlocked, and then click the **Lock / Unlock** button.

An unlock performs a restart of the Routing Manager software. The action takes a few seconds, during which time the Routing Manager is unavailable due to the restart. A lock action is immediate.

These actions can be applied to any particular ARM router. The functionality lets you gracefully take a router temporarily out of service. A locked router responds to all keepalive and login requests, from all nodes, with a standard 'Service Unavailable' HTML error. This behavior causes all nodes to be disconnected from the router, effectively taking the router out of service. The router still responds to any other request from the nodes or the configurator, which makes the lock action graceful since calls, statistical calculations and software upgrades are unaffected.

Adding a Routing Server Group with Internal and External Priorities

The ARM allows you to add a single group of routing servers. The ARM also allows you to add multiple groups of ARM Routers with a policy between them. This may be necessary when an ARM deployment is geographically distributed. ARM customers in circumstances like this prefer having (for example) one of the group of the nearest ARM Routers with Round Robin

policy and to switch to another group of ARM Routers in case all the nearest ARM Routers fail (or become inaccessible). Customers can configure an ARM Routing Servers Group with internal policies (within a group) and external policies (between groups).

➤ To add a Routing Servers Group:

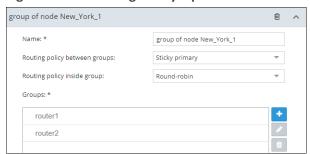

1. Open the 'Routing server groups' page (Settings > Routing Servers > Groups).

Figure 10-31: Routing Server Groups

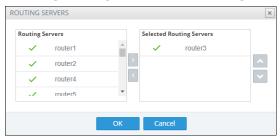

- 2. When prompted, configure the:
 - Name of the group to be attached to a node or to multiple nodes
 - Routing Policy to be applied between groups; 'Sticky primary' is the default. Two
 routing policies between Routing Groups are available:
 - 'Sticky primary' [the node reverts to the primary group when at least one ARM Router is available]
 - 'Sticky Last' [after a node switches to the next Routing Group, it uses its ARM Routers while at least one of them is available]
- **3.** Apply a Routing Policy between the ARM Routers inside the Routing Group ('Round Robin' is the default). Three are available: Round Robin, Sticky Primary and Sticky Last.

Figure 10-32: Routing Policy Options

4. Attach one or more ARM Routing Servers to the Routing Group.

Figure 10-33: Attaching Routing Server/s to a Routing Group

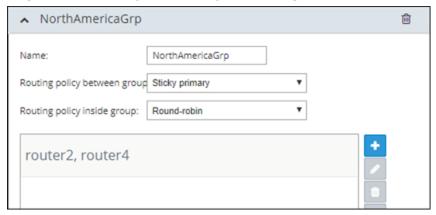

5. To use a single group of routers for a node (or nodes) with a policy between them, one list of selected routing servers is sufficient. When providing multiple sub-groups of Routing Servers, click +.

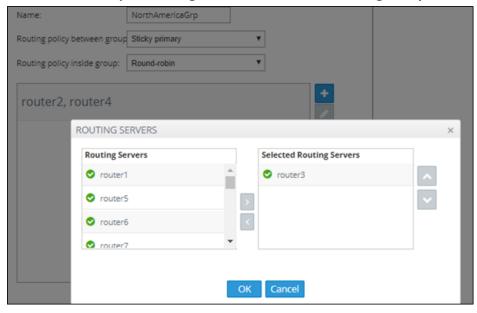

The maximum number of routing servers allowed for the entire server group is 10, so if you have five sub-groups, each can have up to two routing servers inside).

Figure 10-34: Multiple Sub-Groups of Routing Servers

6. Configure a new sub-group of routers with the same Routing Policy inside the group.

Figure 10-35: Sub-Group of Routing Server with the Same Routing Policy

Up to five sub-groups can be configured under the same Name.

7. After configuring an ARM Routing Servers group, attach it to a single node or to multiple nodes (SBCs or Gateways). To do this, apply an **Edit** action on the node.

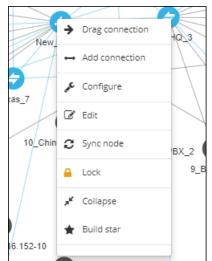

Figure 10-36: Edit Node

8. From the drop-down, select the Routing Server Group (one of the previously configured groups).

Figure 10-37: Edit Node – Selecting Routing Server Group

The ARM provides the corresponding configuration (per ARM-level definitions) to each node and configures the Routing Servers (per Groups and policies) within the SBC or Media Gateway.

- Support for Routing Server Groups is available from node software version
 7.20A.240. If your deployment includes nodes whose software version is earlier
 than 7.20A.240, the ARM provides a backward-compatible way to define routing
 servers by creating Routing Server Groups with a single sub-group; Routing Server
 Groups which have multiple sub-groups are not shown in the drop-down menu.
- When upgrading from previous version releases (when Routing Server Groups were not supported), the ARM upgrade process automatically converts alreadyconfigured routers to a Routing Server Group and that group is attached to the node. For example, if a customer has three nodes (N1, N2 and N3), where N1 and

N2 use ARM Routers R1 and R2 (Round Robin) and node N3 uses ARM Routers R2 and R3 (Sticky Primary), the ARM during the upgrade automatically creates two Routing Server Groups (N1_group with R1 and R2 with Round Robin, and N3_group with R2 and R3 with Sticky Primary). The N1_group is automatically assigned to node N1 and N2. N3_group is automatically assigned to node N3.

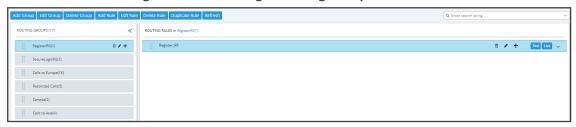

11 Defining Calls Routing

The ARM lets IT managers responsible for enterprise VoIP define call routing. ARM routing provides a comprehensive call routing solution for a telephony network.

> To define calls routing:

Open the Routing Groups page (Routing > Routing Groups).

Figure 11-1: Routing - Routing Groups

> Follow this procedure when defining calls routing policy (ARM Dial Plan):

- 1. Add a new Routing Group (see Adding a Routing Group below)
- 2. Add a new Routing Rule (see Adding a New Routing Rule on page 170)
- **3.** Test the route (see Testing a Route on page 59)

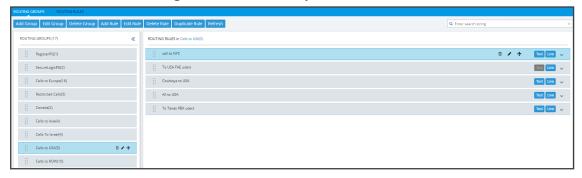

Adding a Routing Group

Before adding a rule, you must add a Routing Group. Routing Groups help present rules in the GUI in an organized fashion, enhancing user experience. Routing Groups also allow you to move a group of Routing Rules, collectively changing their routing priority.

> To add a Routing Group:

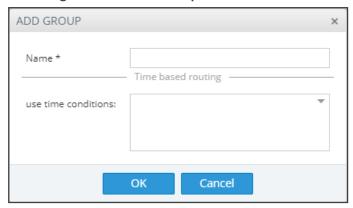

1. In the Routing Groups page (Routing > Routing Groups), click the Add Group button.

Figure 11-2: Add Group

The Add Group screen opens.

Figure 11-3: Add Group

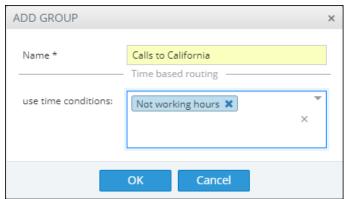

2. Define a name for the Routing Group to be added. Define a user-friendly name to facilitate intuitive management by administrators. Some example of groups you can add are 'Restricted Calls', 'Calls to Europe', 'Calls to Far East', 'Calls to ROW', etc.

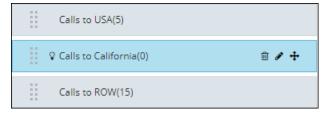

The routing group's name must be distinct from names of other routing group names, and must be between 1-255 characters.

3. From the drop-down, select the **use time conditions** option to attach a time condition to the Routing Group. See Configuring a Time-Based Routing Condition on page 148 for related information on how to attach a time condition to a Routing Rule. You can attach multiple time conditions. These conditions will apply to all rules in the group.

Figure 11-4: Add Group with Time Condition

Note that if you attach a time condition to a group, it's indicated visually in the Routing Groups page:

4. Click **OK**; the new Routing Group is added to the list.

Routing Groups listed higher take precedence over those lower. Routing Groups in the list can be reordered (see Moving a Routing Group on the next page). Priority is calculated internally, based on Previous and Next groups.

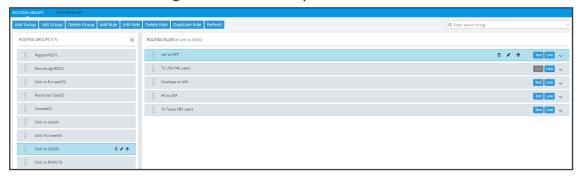

Editing a Routing Group

You can edit a Routing Group if necessary.

> To edit a Routing Group:

- In the Routing Groups page (Routing > Routing Groups), select the Routing Group to edit, and then either:
 - a. Click Edit Group

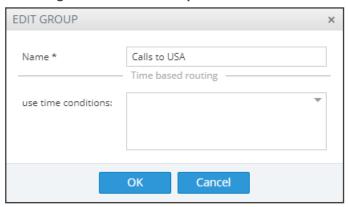

Figure 11-5: Edit Group

b. [Or] Click the group's edit icon in the row

✓

Figure 11-6: Edit Group

- 2. Edit the 'Name' field. Enter a user-friendly name to facilitate intuitive management by network administrators.
- **3.** Edit the time condition. From the **use time conditions** drop-down, you can clear time conditions if defined. See **Configuring a Time-Based Routing Condition** on page 148 for related information. You can alternatively remove a single condition if multiple time conditions are attached.
- 4. Click OK.

Moving a Routing Group

You can promote or demote a Routing Group listed in the Routing Groups page. When moving a Routing Group, all its Routing Rules are moved and the routing priority of all the Routing Rules in the group are collectively changed at once. Routing Groups listed higher in the page take precedence over those listed lower.

> To move a routing group:

1. In the Routing page, under the **Routing Groups** tab, either drag and drop the Routing Group to where you want to locate it, or select it and then click the then-enabled **Move** icon next to it.

The Move Routing Group dialog opens:

MOVE ROUTING GROUP × Before Calls To Israel After Temp. Special Rules Calls to Europe Restricted Calls Calls to USA Calls to ROW Calls to China and Far East rGrp101 rGrp104 rGrp105 rGrp106 rGrp107 Cancel

Figure 11-7: Move Routing Group

2. Select Before or After, click the Routing Group before which / after which to move the Routing Group you want to promote/demote, and then click OK.
Alternatively, you can move a Routing Group by clicking the icon shown in the following figure, and then dragging it and dropping it in the Routing Groups page.

Figure 11-8: Moving a Routing Group by Dragging and Dropping

Deleting a Routing Group

You can delete a Routing Group if necessary, including rules associated with the group.

> To delete a Routing Group:

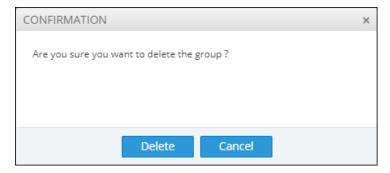

- 1. In the Routing page under the **Routing Group** icon, select the Routing Group to delete and then either:
 - a. Click Delete Group:

Figure 11-9: Delete Routing Group

-or-

b. Click the **Delete** icon in its row which is then enabled. You're prompted to confirm:

2. Click Delete.

Duplicating a Routing Rule

You can duplicate a Routing Rule listed in the Routing Rules page (or in the Routing Groups page). The feature can be of particular benefit to support engineers and Field Application Engineers when they need to define *multiple* Routing Rules that are *similar* to rules already defined, for example, a rule that will have the same actions as a previously defined rule but a different prefix and node.

> To duplicate a routing rule:

1. In the Routing Rules page (Routing > Routing Rules), select the rule to duplicate and then click the then-enabled **Duplicate** button.

ADD ROUTING RULE Live Name * Register_RR Test Group: RegisterRG SOURCE DESTINATION ADVANCED CONDITIONS ROUTING ACTIONS Prefixes / Prefix Groups Hosts User Groups Resource Groups Nodes Peer Connections Cancel

Figure 11-10: Add Routing Rule

2. Modify the duplicated rule to conform to your requirements using Adding a New Routing Rule on the next page as reference.

Adding a New Routing Rule

After adding a Routing Group, add a new Routing Rule to associate with the Group. Each Routing Rule is given a unique priority within the Routing Group. A rule listed higher than another, even if in the same Routing Group, takes precedence.

- Routing rules are defined within Routing Groups.
 - ✓ To view a specific Routing Group's Routing Rules, click that Group.
 - ✓ To view all Routing Rules, click the Routing Rules tab.
- Any modification to the routing configuration (adding, deleting or modifying) takes
 effect within 60 seconds after the modification request is answered by the
 configurator and does not affect active calls.
- Any modification to routing logic because of an operational state change to a node or Peer Connection takes effect within 60 seconds after the status change is identified by the configurator.
- Any modification to routing logic because of a node or Peer Connection administrative state change takes effect within 60 seconds after the status change is identified by the configurator.
- Changes in users or user groups take effect within 60 seconds after the modification is identified by the configurator.

Routing Rules include:

- **Conditions:** [Optional] Define the characteristics of the route request, e.g., the User Group and phone prefix of the originator/destination.
- **Actions:** [Mandatory] Define actions performed if the call matches the rule conditions i.e., routes the call to the specified destination, or discards it specifying a SIP reason.

Figure 11-11: Example of a Routing Rule

The ARM parses from the top Routing Group listed, to the bottom Routing Group listed, and within each Routing Group from the top Routing Rule listed to the bottom Routing Rule listed. If it finds a matching rule and if Nodes, Connections, Peer Connections and Resource Groups are available, it sends the call to the destination configured for that rule. If it doesn't find a matching rule, it indicates that a route for the call has not been found.

Alternative Routing

The ARM performs alternative routing as follows:

- The ARM attempts to build an alternative path for the same Routing Rule action (Nodes, Peer Connections, VoIP Peers and Resource groups), if available. For more information on Resource Groups, see Resource Groups Page Actions on page 44.
- ARM attempts to build an alternative action (Nodes, Peer Connections, VoIP Peers and Resource groups), if available, for this call, in the order that actions are listed in the Routing Rule. For more information on Resource Groups, see Resource Groups Page Actions on page 44.
- All routing alternatives are sorted by weighted path, cost and then by number of hops.

Load Balancing

The ARM can balance call traffic between multiple destinations of the same Action. Call traffic can be distributed equally between destinations, or the distribution can be defined by the operator. Multiple routing attempts can be configured. Default: 1. Max: 3. The max can't exceed the number of destinations in the load balancing action. If a call to a destination configured in a load balancing action fails, the ARM will try to route it to one of the destinations configured in load balancing before searching for a new rule or action for it.

Registered users

The ARM can route a call only if the destination number is the number of a registered user in ARM (listed in the Registered Users table) and the Routing Rule is then matched.

Discard Call

The ARM can be configured to discard calls matching specific conditions as a single action, or as the last action of a rule if previous destinations were unavailable.

> To add a new Routing Rule to a Routing Group:

1. In the Routing Groups page under the **Routing Groups** tab, select the Routing Group with which to associate the rule, and then click **Add Rule**.

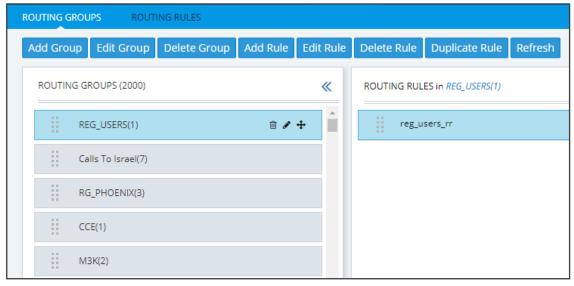

Figure 11-12: Add Rule

This screen opens:

ADD ROUTING RULE

Name *
Group: REG_USERS

SOURCE DESTINATION ADVANCED CONDITIONS ROUTING ACTIONS

Prefixes / Prefix Groups

Hosts

User Groups

Resource Groups

Nodes

Peer Connections

OK Cancel

Figure 11-13: Add Routing Rule

- 2. Enter a name for the routing rule that is distinct from the names of the other routing rules in the same group. Define a user-friendly name to facilitate intuitive management by network administrators. The name can be between 1-255 characters.
- 3. Enable Live and/or Test mode. See Testing a Route on page 59.
 - Live. The rule will be taken into consideration for live calls traffic.
 - Test. The route will be tested offline without impacting live calls traffic.

By default, new routing rules are added with **Test** mode enabled and **Live** mode disabled. It is highly recommended to test the newly added routing rule before enabling it for live calls.

The following table shows the combinations that are supported for a Routing Rule:

Table 11-1: Live | Test Mode Combinations

Live Test Combination	Explanation
Live is enabled	The rule will be considered for both test and live traffic.

Live Test Combination	Explanation
Test is enabled	
Live is enabled Test is disabled	The rule will be considered only for <i>live traffic</i> . Test mode won't be impacted. Select this option to simulate rule removal.
Live is disabled Test is enabled	The rule will only be considered only for test mode. Live traffic won't be impacted. Select this option to simulate and test a newly added rule.
Live is disabled Test is disabled	The rule will not be considered for test nor live traffic. Select this option to prepare a Dial Plan.

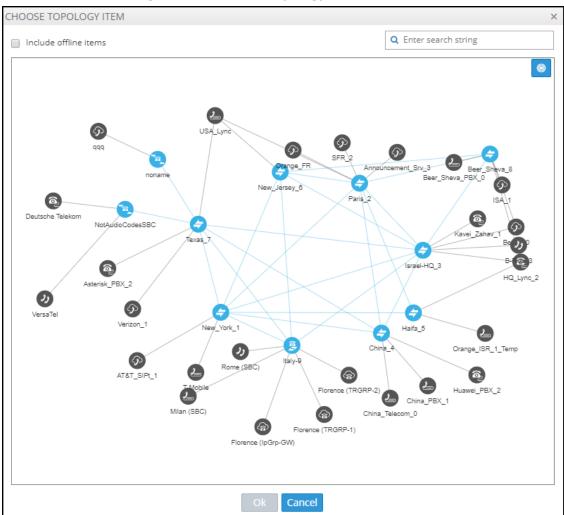

4. Configure the settings under 'Source'. Use the following table as reference.

Table 11-2: Source Settings

Setting	Description
Prefixes/Prefix Groups	Enter a source number prefix, or list of prefixes. You can also enter the name of a prefix group, or from the drop-down menu select a prefix group or list of prefix groups.
Hosts	Enter a source hostname, or list of hostnames.
User Groups	Enter the name of a source user group or list of source user groups, or select user groups from the drop-down menu. See Adding Users Groups to the ARM on page 81.
Resource Groups	From the drop-down, select a Resource Group. This setting is mandatory to define a routing rule applicable to <i>specific call sources</i> rather than (globally) to the entire network. Resource Groups comprise Nodes, Peer Connections and VoIP Peers.
Nodes	From the drop-down, select a source Node or Nodes, or click the icon to visually select the element from the Choose Topology Item screen shown in the figure following this table. This setting is mandatory to define a routing rule applicable to <i>specific call sources</i> rather than (globally) to the entire network. Note: To select multiple elements in the Choose Topology Item screen, press Ctrl and click the elements to select.

Setting	Description
Peer Connections	From the drop-down, select a source Peer Connection or Peer Connections, or click the icon to visually select the element from the Choose Topology Item screen shown in the figure following this table. This setting is mandatory to define a routing rule applicable to specific call sources rather than (globally) to the entire network. Note: To select multiple elements in the Choose Topology Item screen, press Ctrl and click the elements to select.

Figure 11-14: Choose Topology Item

5. In the Add Routing Rule screen, click **Destination**.

Name *
Group: REG_USERS

SOURCE DESTINATION ADVANCED CONDITIONS ROUTING ACTIONS

Prefixes / Prefix Groups

Hosts

User Groups

OK Cancel

Figure 11-15: Destination

6. Configure the 'Destination' settings using the following table as reference.

Table 11-3: Destination Settings

Setting	Description
Prefix/Prefix Groups	Enter a destination number prefix, or list of prefixes. You can also enter the names of a prefix group or select prefix groups from the drop-down menu.
Hosts	Enter a destination hostname or list of hostnames.
User Groups	Enter the names of a user group, or list of destination user groups or select user groups from the drop-down menu.

7. In the Add Routing Rule screen, click **Advanced Conditions**.

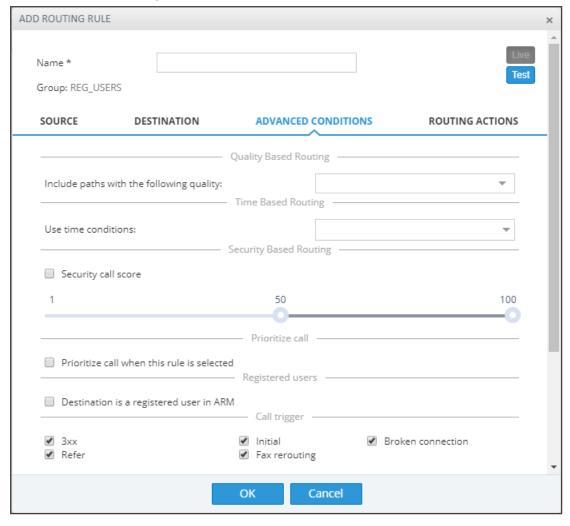

Figure 11-16: Advanced Conditions

- 8. Under 'Quality Based Routing', select the option **include paths with the following quality**; the drop-down menu becomes available. From it, select the quality criteria that you defined as shown in **Routing Settings** on page 146. Criteria for bad, fair and good quality, based on the calculation of MOS and ASR, can be defined. This screen lets you associate the criteria you defined with the Routing Rule.
- 9. Under 'Time based routing', select from the drop-down menu the time on which routing will be based, configured under Settings > Routing > Time Based Routing (see Routing Settings on page 146 for information about configuring a time range).

- More than one Time Condition can be associated with the same Routing Rule.
 Activation of the Routing Rule is then performed in 'or' between Time Conditions.
- A Time Condition can be attached to a Routing Rule which belongs to a Routing Group with an already-associated period; the ARM's calculation of this Routing Rule's activation will then be 'and'; the rule will be activated during the period assigned to the Routing Group and the period assigned to the Routing Rule.
- **10.** Under Security Based Routing, select the **Security call score** option only if the 'SecureLogix' web service is used. Once enabled, the Routing Rule will use the score

- returned from the 'SecureLogix' web service as part of the match. The slider is used to control the score threshold. If no score is returned from the 'SecureLogix' web service or the score doesn't match the threshold, the rule will not be matched.
- 11. Select Prioritize call when this rule is selected to prioritize emergency calls over regular calls. The ARM supports emergency call preemption for SBC and gateway calls. If one of the devices is unavailable to process an emergency call because of lack of resources, a regular call will be preempted to free up resources so that the emergency call will be established. The ARM may preempt more than one active call to provide sufficient resources for processing the emergency call. Emergency calls can be identified by the matching rules parameters in the Add Routing Rule screen.
- 12. Under Registered Users, select **Destination is a registered user in ARM**; the routing rule will then be matched only if the destination number is a registered user number (listed in the Registered Users table).
- 13. Under 'Advanced Conditions', select a Call Trigger to activate the rule for a specific Invite reason (i.e., alternative routing). By default, all 'Call Trigger' options are selected, so routing by default is based on all Call Triggers. At least one must be selected. The node applies to the ARM for a routing decision when it is triggered by another condition such as a fax call or a Broken RTP connection. You can configure a rule to be triggered for example only for a fax call or for a 'Refer call'. Call Trigger options are:
 - 3xx [Re-routes the request if it was triggered because of a SIP 3xx response]
 - REFER [Re-routes the INVITE if it was triggered because of a REFER request]
 - **Initial** [This routing rule is used for regular requests that the device forwards to the destination]
 - Broken Connection [If the Node detects a broken RTP connection during the call and the Broken RTP Connection feature is enabled in Pcon Ip-Profile (IP Profile > Broken Connection Mode = Reroute), you can use this option as an explicit matching characteristic to route the call to an alternative destination.
 Note that it's not supported for an incoming call from a third-party Pcon.
 - Fax rerouting [This trigger will be used if the Node detects a call as a fax and the fax recognition feature is enabled on the Peer Connection. To enable the feature, the device Web interface's 'Routing Mode' parameter must be configured to Rerouting without delay (IP Profile > Rerouting Mode). Make sure this IP Profile is associated with the relevant IP Group. You can use this option as an explicit matching characteristic to route the call to an alternative fax destination.

Fax call trigger is unsupported for incoming calls from third-party Peer Connection.

14. Each rule is by default relevant in all circumstances because all Call Triggers are selected by default, but if you want to provide specific routing, for example, for fax calls only, select it as follows:

Figure 11-17: Trigger/s Selected

		Call trigger —
☐ 3xx	Refer	Initial
Broken connection	✓ Fax rerouting	

In this case, the initial call is routed according to the generic Routing Rules (followed by the SIP Invite message). When the SBC categorizes this call as a fax call, another request for routing is sent to the ARM with the 'Fax Rerouting' trigger. This routing request matches another ARM Routing Rule dedicated for fax rerouting. In this way, you can route fax calls to a 'Fax-to Mail' server (for example).

15. Under 'Rule match', select **Send notification upon match** to enable a notification on a call (for example, a 911 emergency call) if the call matches a specific rule.

When the ARM receives a call matching this rule condition, a notification (event) with related information is issued by the ARM Configurator. At the ARM level, the event can be sent to an SNMP target. With the ARM integrated into the OVOC, the call notification can trigger the issuance of an email by the OVOC, for example:

```
**** Event Info ****
Alarm Name: General Alarm
Date & Time: 09:24:16 AM September 6, 2018
Source: Router#172.17.113.23
Source Description:
Severity: info
Unique ID: 67
Alarm Type: other
Alarm Probable Cause: other
Description: Routing Rule 911 was matched
Additional Info 1:
Additional Info 2: Routing Rule "911" of Group "911" is
Call from Pcon "Pcon Pcon-1" , Node "Node 16161104" -
From number "+12345", To number "911".
Additional Info 3:
***** ARM Info *****
ARM IP Address 172.17.113.23
```

Notifications are typically required and used for 911 emergency calls, which should typically be reported via an email application or another notification application. The notification engine, however, can be used for any other matching rule.

16. Under 'Advanced Conditions' in the 'Privacy' section of the Edit Routing Rule screen, you can configure Calling Number Privacy. The ARM supports calling number privacy with different flavors (Privacy policy). The policy is applied per Routing Rule.

Privacy policy:

Sip headers

Transparent

Transparent

Transparent with privacy id

Anonymous caller

Identify caller

Figure 11-18: Edit Routing Rule - Privacy policy

If a call matches the rule, the Privacy Policy is applied. Based on the Privacy Policy of the matching rule, the ARM instructs the SBC or Gateway how to handle calling number privacy in terms of SIP headers. Privacy Policy options are:

Table 11-4: Privacy Policy Options

ARM Value	SBC Value	Comment
Transparent	[0] Transparent	Default. Leave as is.
Transparent with Privacy ID	[1] Don't change privacy	Regular call = regular call (as is)Anonymous = Anonymous + Normalization of URI
Anonymous caller	[2] Restrict	Turn the call into anonymous
Identify caller	[3] Remove Restriction	If a regular call, stay as isIf anonymous, make it exposed in the SIP 'From' header

17. [Optional] You can route calls based on any SIP Invite header value as a Routing Rule matching criterion, for example, based on specific SDP information or on a TGRP value; any information present in the SIP Invite can be used as a condition in the ARM Routing Rule. The feature must be configured at both ARM and SBC level.

18. SIP Headers

- Configure the 'name' field, i.e., the SIP header name
- Configure the 'value' field, i.e., one or more possible values for rule match. The match within the same SIP header name is handled as OR and between the headers as AND. In the following ARM rule, the match is detected when the ARM gets X-ARM-DETAIL-X headers which include: ("tgrp=100" OR "tgrp=200") AND ("coder=711" OR "coder=729").

When the SBC gets a new call (SIP Invite), it sends a REST routing request toward the ARM. This routing request includes parsed SIP information, for example, X-Header. In this way, using SBC-level manipulation, the X-Header can include any information operators want to

pass to the ARM (for further routing decisions). This is the pre-agreed way to pass any SIP header information.

After applying SBC-level manipulation, the operator can configure ARM-level Routing Rules with a condition related to the required attributes and value (pre-installed using SBC-level manipulation).

The ARM is aware of the information followed by the preconfigured 'X-ARM-DETAIL-N' header and ready to use it for routing.

19. [SBC-Level Configuration] To send a parsed information request, add a new header with name "X-ARM-DETAIL-1", "X-ARM-DETAIL-2"... "X-ARM-DETAIL-N" and with information inside taken from the SDP or any other SIP header. X-ARM-DETAIL-X format is "X-ARM-DETAIL-1:<name=value>"

For example:

- X-ARM-DETAIL-1: "tgrp=100"
- X-ARM-DETAIL-2: "coder=711"

To create a new header in the SBC, add a new 'Call Setup Rules Set ID' in 'IPGroup' or in 'SIP Interface' in the device's Web interface. The figure below shows 'IPGroup'.

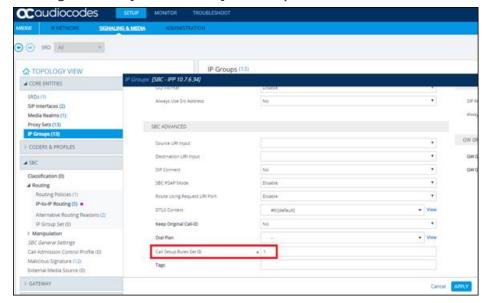

Figure 11-19: [Web Interface] Call Setup Rules Set ID

Setup rules can then be associated with the same Set ID. In the following figure, the manipulation added is 'tgrp=100'. In general, you can use a condition with RegEx and take the attributes into the Action Value.

Figure 11-20: [Web Interface] Viewing SBC Call Setup Rules Configuration

20. In the ARM's Add Routing Rule screen, click **Routing Actions**.

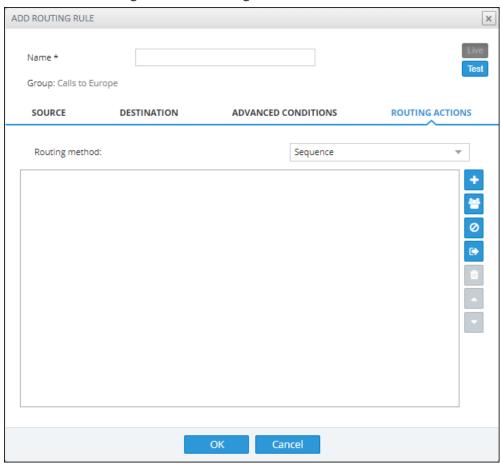

Figure 11-21: Routing Actions

21. From the 'Routing method' drop-down, select **Sequence** or **Forking**.

The parameter 'Routing method' is configured by default to Sequence; Routing Rule Actions are applied sequentially (the only option in ARM versions earlier than 8.6).

If you configure 'Routing method' to Forking, the actions are applied simultaneously and the call is split to all the destinations. The ARM supports calls forking at a network level. SIP forking refers to the process of 'forking' a single SIP call to multiple SIP endpoints. A single

call can be split to many endpoints at the same time. The first extension (SIP end-point) to pick up the call receives the call; all other extensions then stop ringing.

Forking implementation in the ARM is designed to split specific calls (matching preconfigured condition) between several network-wide destinations (Peer Connections, VoIP Peers or nodes). Forking is integrated into ARM Routing Rules logic. Forking is applied if a call matches the Routing Rule condition.

Forking implementation in ARM utilizes SBC forking capabilities. When a call matches an ARM routing rule condition with forking, the ARM instructs the SBC to perform forking per the actions configured in ARM Routing Rule.

The ARM supports up to three forking legs (different actions). If one or more of the actions with Forking Routing methods includes load balancing between multiple destinations, the load balancing (with configured percentages) will be applied to choose the correct destination of the forking leg.

Figure 11-22: Calls Forking Routing Rule

- When upgrading from an earlier ARM version than 8.6, all Routing Rules are translated with the Sequence routing method (the default).
- In the ARM, forking capabilities can only be applied to SBCs. Media Gateways aren't supported.
- Forking in the ARM is supported on SBC software 7.20.252 GA or later (release pending). For earlier SBC versions, Forking functions like 'Sequence'.
- 22. Under 'Routing Actions', click the 'Add action' button located on the right side of the screen.

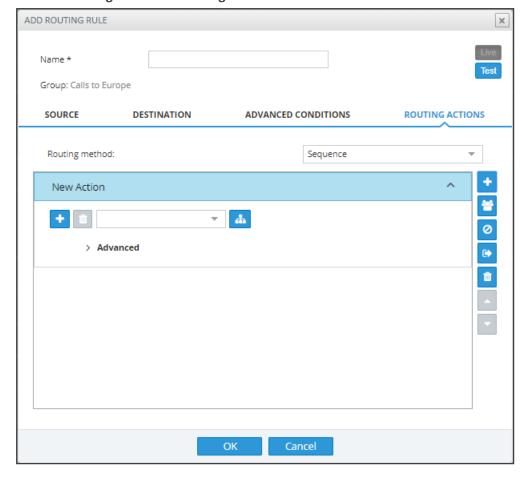

Figure 11-23: Routing Actions - New Action

a. Select from the drop-down menu the Peer Connection, VoIP Peer, Node or Resource Group to which the call will be routed; the list is categorized; best practice is to scroll down the list to the category and then select the entity. Alternatively, click the adjacent button; the 'Choose Topology Item' screen shown in the next figure is displayed; from this screen you can select the VoIP Peer, Peer Connection or Node. In large networks with high numbers of topology elements, this visual method of selecting the topology element may prevent human error from occurring and facilitate correct selection.

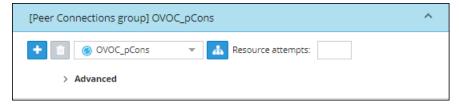

Figure 11-24: Choose Topology Item

If a Resource Group is selected for an action, a 'Resource Attempts' field is displayed, as shown in the following figure.

Figure 11-25: Resource Attempts

- **b.** Configure the number of 'Resource attempts', i.e., the number of elements the ARM will try before going to the next action. The maximum number of attempts that can be configured = the number of elements in the Resource Group.
- **c.** Click > **Advanced** to open post routing (after routing) normalization.

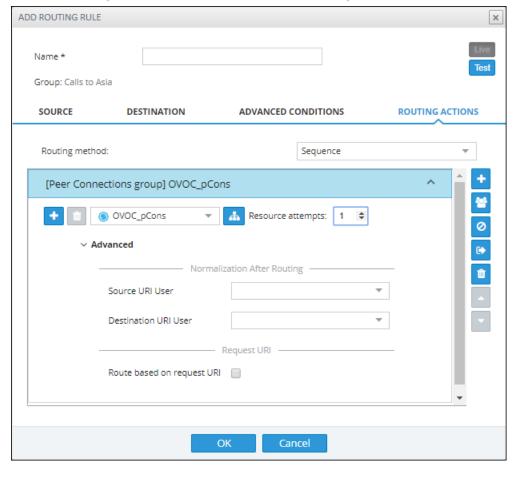

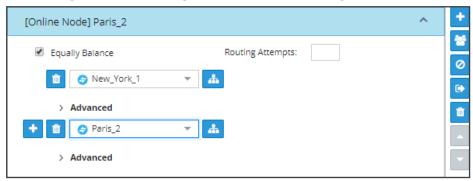

Figure 11-26: Normalization After Routing

- From the 'Source URI User' drop-down, select the source element (see Adding a Normalization Group on page 132) to manipulate the source number in the outgoing call to the Peer Connection. The source normalization group can only be connected to an IP Group or VoIP Peer. It cannot be connected to a Node.
- From the 'Destination URI User' drop-down, select the destination element (see Adding a Normalization Group on page 132) to manipulate the destination number in the outgoing call to the Peer Connection. The destination normalization group can only be connected to an IP Group or VoIP Peer. It cannot be connected to a Node.
- 23. Optionally select the Route based on Request URI check box under the 'Request URI' section (under section 'Normalization After Routing') to enable combined ARM and SIP based routing decisions on a per-action basis, for when a customer (or a customer's network) provides routing instructions for a call as part of the SIP INVITE message (via REQUEST URI). The Peer Connection (the SBC's IP Group) must be specified in the action as well. SIP based routing takes place in the context of a specific SBC and IP Group. In this way, the ARM will route a call until a specified SBC and request the SBC to use 'REQUEST URI' for further routing. The feature is available for SBCs only.
- 24. Click the 'Add load balancing' button located to the left of the field displaying the selected Peer Connection, VoIP Peer or Node; the screen adds the following items:

- Equally Balance option (selected by default)
- 'Routing Attempts' field
- Drop-down field for selecting Peer Connection, VoIP Peer or Node with an 'Add load balancing' button located next to it

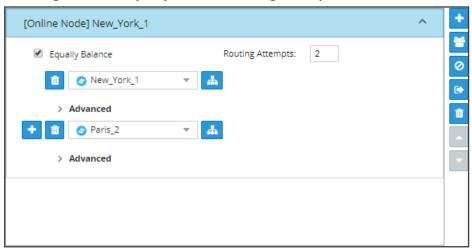

Figure 11-27: Routing Actions – Load Balancing

Load balancing is added between more than one Peer Connection, Node, VoIP Peer or Resource Group. By default, these are equally balanced, i.e., the same percentage is assigned for each option.

- **25.** (Optional) Clear the **Equally Balance** check box to define your own percentage. Any distribution can be chosen, i.e., any percentage of calls can be handled by a specific routing option. Several routing destinations (more than two) are supported by using the 'Add load balancing' button.
- **26.** Enter the percentage of routes that will take this action when load balancing is configured and **Equally Balance** is cleared. Make sure you have 100% in the Action's calls destinations summary else you won't be allowed to enable the action.
- 27. Configure the parameter 'Routing Attempts' as shown in the following figure. The maximum attempts that can be configured is 3. Default: 1. The maximum number of 'Routing Attempts' can't exceed the number of destinations in the action; see for example the action [Online Node] PARIS_2 in the following figure.

Figure 11-28: Equally Balance: Routing Attempts = 2

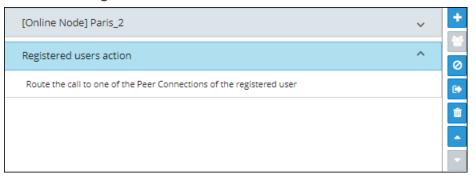

The 'Routing Attempts' parameter determines the number of attempts that will be made within the load balancing action. If load balancing is configured within a Routing Rule's Action and a call to a destination configured in this Action fails for some reason, the ARM will try to route the call to one of the destinations configured in load balancing before searching for a new rule or action for the call.

28. Click > Advanced in order to apply number manipulation on the Source URI and / or the Destination URI.

- To remove a Peer Connection, Node, VoIP Peer or Resource Group, click the adjacent trash can.
- To remove an entire action, click the trash can on the right side of the screen.
- 29. (Optional) Click the **Route to user location** button located on the right side of the screen.

Figure 11-29: Route to user location

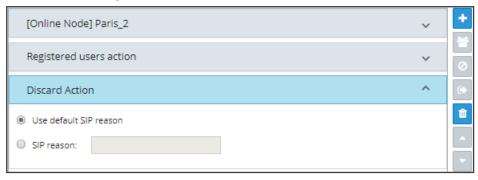

The ARM will now attempt to route the call to the location of the registered user (the destination number is used as the key to search for the location).

The ARM supports forking for registered users. If the Routing Rule's 'Routing Method' is set to 'Forking' and the action is set to 'Registered Users' ('Route to user location'), the ARM will attempt to apply forking if the same user is registered in multiple SBCs.

30. (Optional) Add a discard action by clicking the 'Add discard action' button located on the right side of the screen.

Figure 11-30: Add Discard Action

In a routing rule, you can apply a policy to attempt multiple routing options and to discard the call if none succeed. The action 'Discard Action' can be used - in addition to other routing actions of the same rule - as a last routing rule action or as a sole action.

31. Configure the action using the following table as reference

Table 11-5: Discard Action

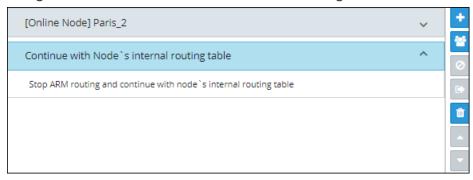

Setting	Description
Use default SIP reason	Select the default SIP reason (the last SIP reason received from the SBC or the Gateway) or provide a specific SIP reason as shown in the next parameter description
SIP Reason	Select this option for a specific SIP reason to be returned to the source peer connection when rejecting the call. Must be a valid SIP reason.

If any field is left empty (Prefix Group/Host/User Group/Node/Peer Connection), the rule will not check it.

32. Click the button (Stop ARM routing and continue with node's internal routing) located on the right side of the screen. This feature enables a combined routing decision taken by the ARM and a node (SBC only). The feature enables customers to specify that after a specific number of routing attempts configured in ARM routing, they'd like to continue with the local SBC routing table. The ARM supports a new action in the Routing Rule: Stop ARM routing. A second action follows this: Stop ARM routing and continue with node's internal routing This action is always the last option in a Routing Rule. The feature is only available for SBC nodes.

Figure 11-31: Continue with Node's internal routing table

The feature additionally allows current AudioCodes SBC customers who want to use ARM Security-based Routing (integrated with SecureLogix) without immediately moving to the ARM. These customers can use ARM's SecureLogix integration feature but must indicate in their routing rule that the calls must be routed based on the SBC's existing routing table. ARM routing capabilities can be provisioned in future.

Fields such as 'Nodes', 'Peer Connections' and 'User Groups' in the Add Routing Rule screens and Edit Routing Rule screens feature filters in which network administrators can select multiple elements and then *invert the selection*. The feature improves usability and user experience especially in large networks with high numbers of elements. The feature allows network administrators to

- Select a single element
- Delete a single element (x)
- Select All elements
- Clear all selected elements
- Select All and delete a few (x)
- Select All, delete a few (x) and then invert the selection; the elements deleted will be in the selection
- Select a few elements and then invert the selection; only elements that weren't selected will be in the selection
- Clear a selection

Moving a Routing Rule

You can move a rule within the group under which it is defined, or you can move it to another group, above or below a rule defined within that group.

> To move a rule:

- 1. Click the Routing Group under which the rule is defined and then
 - Drag and drop the rule to the Routing Group you want to move it to -OR-
 - Select the rule to move and then click the 'move' icon; the Move Routing Rule dialog is displayed.

Figure 12-1: Move icon

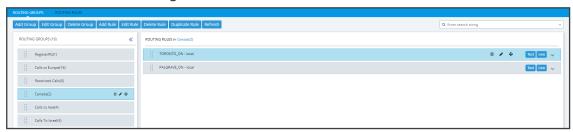

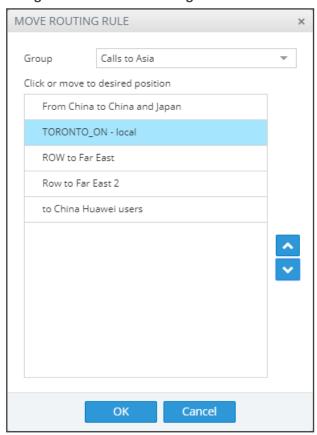

Figure 12-2: Move Routing Rule

2. From the 'Group' drop-down menu, select the new group to which to move the rule to.

3. Click or to locate the rule within the new group's rules -OR- click a rule above which you want your rule to be moved.

4. Click **OK**; the rule is moved to the location you defined.

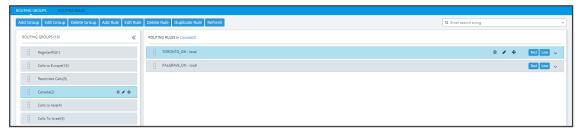

Deleting a Rule

You can delete a rule if necessary.

> To delete a rule:

 Click the group under which the rule is defined and then adjacent to the defined rule that you want to delete, click the now-enabled **Delete** icon shown in the following figure – ORclick the now enabled **Delete Route** button also shown in the following figure.

Figure 12-3: Delete Icon

2. In the Confirmation prompt 'Are you sure you want to delete this rule?' shown in the following figure, click **Delete**.

Figure 12-4: Delete Icon

The rule is deleted.

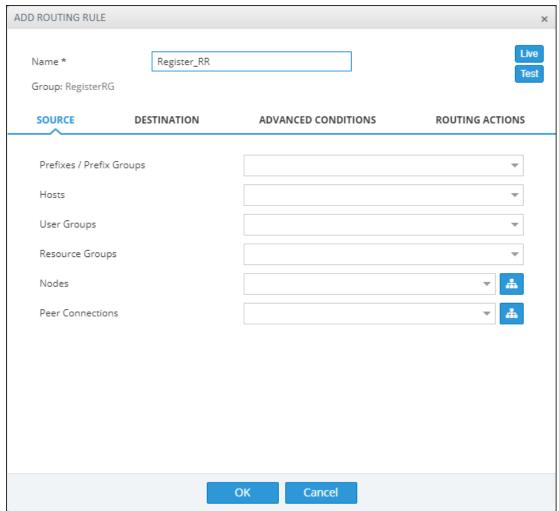

Duplicating a Routing Rule

You can duplicate a Routing Rule listed in the Routing Rules page (or in the Routing Groups page). The feature can be of particular benefit to support engineers and Field Application Engineers when they need to define *multiple* Routing Rules that are *similar* to rules already defined, for example, a rule that will have the same actions as a previously defined rule but a different prefix and node.

> To duplicate a routing rule:

1. In the Routing Rules page (Routing > Routing Rules), select the rule to duplicate and then click the then-enabled **Duplicate** button.

Figure 12-5: Add Routing Rule

2. Modify the duplicated rule to conform to your requirements using Adding a New Routing Rule on page 170 as reference.

Testing a Route

You can test a route to make sure it performs according to expectations. See Testing a Route on page 59 for more information.

Using the Routing Rules Table View Page

Some network administrators prefer to manage routing rules in the Routing Rules table view page. The page offers a significant advantage: Administrators can select multiple rules and perform a multiple-action on the selection.

> To open the page:

1. In the Routing page, click the Routing Rules menu.

Figure 12-6: Routing Rules Table View Page

- 2. Select a rule or select multiple rules; the actions buttons are activated. Administrators can:
 - Edit a rule
 - Delete rules
 - Off exclude rules from live calls
 - Live include rules in live calls
 - Duplicate a rule (allows administrators to conveniently and easily add a rule based on an already defined rule)
 - Move rules
- **3.** In the 'Search' field, enter a search string. The functionality allows administrators to search in all the defined rules, not just in a Rules Group.

13 Viewing CDRs and Call Details

The ARM features the capability to store calls information and call-detail records (CDRs). The application displays ARM-routed calls information in the Calls List page. The page helps operators debug call routing. The page displays routing information collected and correlated from multiple routers. Information displayed includes unsuccessful routing attempts, number manipulation information, call routing paths, SIP reason, call session ID, etc. The page helps operators better understand and monitor call routing in their network.

To view CDRs and Call Details:

Click the Calls menu to open the Calls List page.

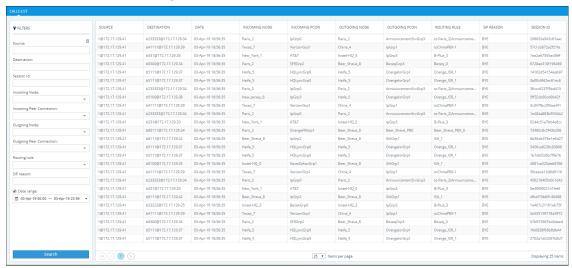

Figure 13-1: Calls List

Each row in the page represents an ARM-routed end-to-end call which can pass multiple nodes (SBCs or Gateways) and multiple Connections and Peer Connections. Information on a call is collected by the ARM Configurator from ARM Routers, and then correlated to display a single call record.

During call processing, each ARM Router periodically sends a bulk of call information (CDRs) to the Configurator for processing. The received CDRs are processed and transformed / correlated into a single call record for each ARM end-to-end call. These records are stored in the ARM Configurator's database (MongoDB).

The page displays:

- Filters on the left side of the page, used to facilitate searching for calls and to exclude unwanted calls from the Calls List
- Calls List to the right of the filters, with a predefined call digest (information)
- 2. Use the following table as reference when using filters:

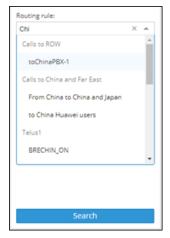

Table 13-1: Filter Descriptions

Filter	Description
Source	Enables filtering the Calls List per URI before manipulation.
Destination	Enables filtering the Calls List per URI before manipulation.
Session ID	Enables filtering the Calls List per Unique Session ID identifying a specific call.
Incoming Node	Enables filtering the Calls List per the node from where a call was initiated; selected from the drop-down menu.
Incoming Peer Connection	Enables filtering the Calls List per the Peer Connection from where the call was initiated; selected from the drop-down menu. If an incoming node is selected, the incoming Peer Connection option in the filter will include only relevant Peer Connections, associated with the selected node.
Outgoing Node	Enables filtering the Calls List per the node from where the call exited the ARM network (terminated); selected from the drop-down menu.
Outgoing Peer Connection	From the drop-down menu select an Outgoing Node; the Outgoing Peer Connection option in the filter will include only relevant Peer Connections associated with the selected node.
Routing rule	Enables filtering the Calls List per the name of the Routing Rule matching the call and used for its routing; selected from drop-down menu and organized per the Routing Groups.
SIP reason	Enables filtering the Calls List per the SIP reason for why the call was terminated.
Date range	Enables filtering the Calls List per a range of dates specified.

If you enter a name in a drop-down (e.g., routing rule or incoming node), options are auto populated.

You can remove a filter by clicking \mathbf{x} .

Figure 13-2: Calls List Filters

The following columns (call digest) is shown for CDRs / Calls in the Calls List:

- Source
- Destination
- Date
- Incoming node
- Incoming Peer connection
- Outgoing node
- Outgoing Peer Connection
- Routing rule
- SIP reason
- Session ID

Figure 13-3: Call Columns in the Calls List

Call Details

The details of a specific call can be viewed. In the Calls List page, filter the list and then double-click a specific call for the Call Details page to open.

Figure 13-4: Call Details

The page displays detailed information on most routing aspects of the call and shows each routing path the ARM attempted.

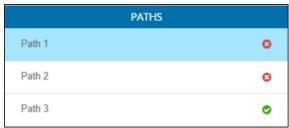

The Call Summary pane displays the following routing information about the call:

Figure 13-5: 'Call Summary' Pane

The Paths pane displays the list of paths the ARM attempted when routing the call.

Figure 13-6: 'Paths' Pane

Select a path (routing attempt) to view detailed information about that path. After selecting a path, it's highlighted in the ARM Topology map. The Path Summary pane (shown below) changes per the selected path.

Figure 13-7: 'Path Summary' Pane

Use the table as reference to the Path Summary.

Table 13-2: Path Summary

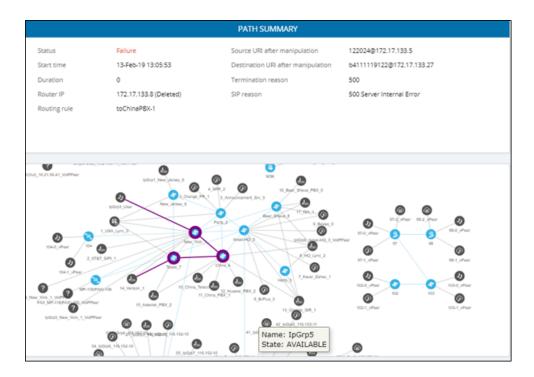

Setting	Description
Status	Displays whether the path was Success or Failure.
Start time	Displays the ARM setup time.
Duration	Displays the call duration; non-zero if 'Status' is Success.
Router IP	Displays the IP of the Router which handled the initial Routing request.
Routing rule	Displays the call matching Routing rule used by the ARM to apply a specific routing path.
Source URI after manipulation	Displays the Source URI after manipulation.
Destination URI after manipulation	Displays the Destination URI after manipulation.
Termination reason	Displays the reason why the specific path was terminated.
SIP reason	Displays the specific path's SIP termination reason.

If Source or Destination URI manipulation was applied for a specific path, the manipulation information will be accessible from the displayed **More** option. The pane's **More** option allows you to review the details of the applied manipulation rules.

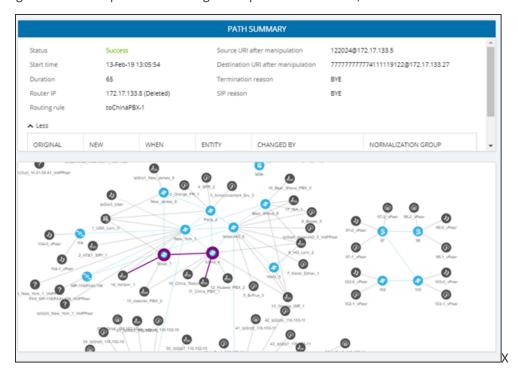

Figure 13-8: 'More' Pane Displaying Details of Applied Manipulation Rules

This figure shows the path of a call's routing attempt whose status was Failure:

This figure shows the path of a routing attempt of the same call, whose status was Success:

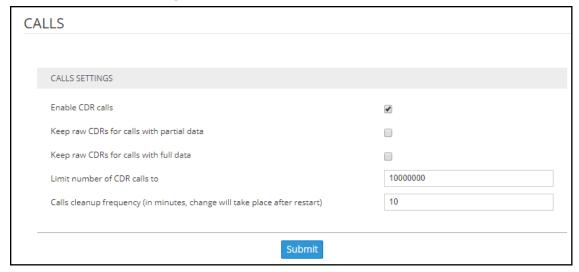

Disabling, Limiting the Number of CDRs

The Call Detail Records feature is by default enabled. You can optionally disable it. You can also control the number of records the ARM keeps in the database. The default number of records is 10 million. This is also the maximum number.

> To control call records:

1. Open the Calls screen (Settings > Network Services > Calls).

Figure 14-1: Calls

2. Use the following table as reference.

Table 14-1: Calls

Setting	Description
Enable CDR Calls	Optionally disable CDRs by clearing the selection. By default, the parameter is selected (enabled). If you're running more than 150 CAPS traffic, it's recommended to disable CDRs.
Keep raw CDRs for calls with partial data	If selected, the ARM saves all CDRs processed to create 'end-to-end calls' for calls terminated before all information about them was received. This parameter impacts database size so the default is unselected; you'll not be able to save 10 million calls. Enable the parameter for debugging purposes only.
Keep raw CDRs for calls with full data	If selected, the ARM saves all CDRs processed to create 'end-to-end calls' for calls terminated successfully. This parameter impacts database size so the default is unselected; you'll not be able to save 10 million calls. Enable the parameter for debugging purposes only.
Limit number of	Enter the number of CDRs to limit the ARM to. If you're running more

Setting	Description
CDR calls to	than 150 CAPS traffic, it's recommended to disable CDRs.
Calls cleanup frequency	Determines how often the ARM checks the size / number of calls. Default: Every 10 minutes. The parameter depends on the number of CAPs. After changing the parameter, restart the ARM Configurator.

15 Viewing Alarms

The Alarms page shown in the figures below displays alarms generated in the enterprise's network topology, e.g., SBC disconnected. In the page, you can view alarms information displayed under two tabs:

- Active Alarms (default)
- History Alarms

Active Alarms | History Alarms

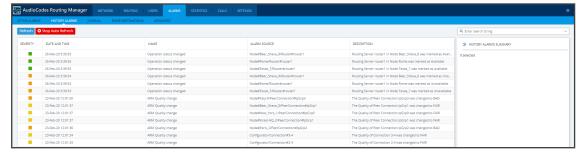

The Active Alarms and the History Alarms pages under the Alarms menu display these column headers:

- SEVERITY
- DATE AND TIME
- NAME
- ALARM SOURCE
- DESCRIPTION

Figure 15-1: Alarms – Active Alarms + Alarm Summary

Figure 15-2: Alarms – History Alarms

Click any alarm listed on any page; that alarm's ALARM SUMMARY pane, shown in the preceding figure, displays the column information as well as:

- ALARM TYPE
- PROBABLE CAUSE
- ADDITIONAL INFO1
- ADDITIONAL INFO2

ACKNOWLEDGED

In the Active Alarms and History Alarms pages you can:

- Sort alarms, according to column header
- Use the 'Search' feature to locate specific alarms (see Locating a Specific Alarm on the next page below).
- Refresh the page / Stop Auto Refresh
- Acknowledge Alarm [Applies only to the Active Alarms page] Click the button to clear a selected alarm from the page. Note that after acknowledging it, the alarm can be still viewed in the History Alarms page.

Journal Page

The Journal page allows you to view historical actions and activities performed in the ARM by all operators, up to the present time.

The page can help you determine if another operator's action or activity may have changed network functionality and been responsible for an active alarm.

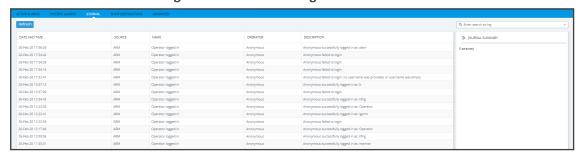

Figure 15-3: Journal Page

The page helps you 'debug' a routing issue that may occur in the network. Each row chronologically indicates an operator action | activity. Selecting a row displays the details of that action | activity in a Journal Summary pane located on the right side of the page.

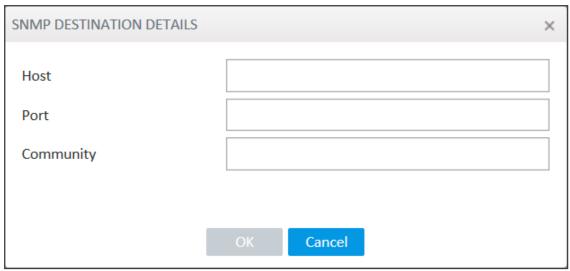

Collecting Info via SNMP to Enhance IP Network Telephony Performance

This feature provides enterprise network administrators the option to collect information on devices via Operations Support Systems (OSS) traps sent over Simple Network Management Protocol (SNMP). Network administrators can then modify that information to enhance telephony network performance.

> To collect information via SNMP:

1. In the Alarms page, click the **SNMP Destinations** tab and then click **Add**.

Figure 15-4: SNMP Destination Details

2. Use the following table as reference.

Table 15-1: SNMP Destination Details

Setting	Description
Host	Enter the IP address of the OSS host.
Port	Enter the number of the port to which to send OSS traps.
Community	SNMP Community String. Sent with each Get-Request as a type of password to allow or deny access.

Locating a Specific Alarm

The search feature helps administrators quickly and easily locate specific alarms. This facilitates effective management which in turn leads to improved network performance.

> To search for a specific alarm:

1. Enter a search string in the search field shown in the following figure. To perform an advanced search, click the drop-down menu arrow; the figure shown after the next figure is displayed.

Figure 15-5: Search Field

Q Enter search string Name Severity Acknowledged False Source Description Between Times Start date 17-October-2019 End date 17-October-2019 23 Last 24 hours Last week Last 30 days Search Cancel

Figure 15-6: Searching for a Specific Alarm

- 2. Enter any information about the alarm you know. You must enter information in at least one field.
 - The 'Name' field is identical to the simple search string field.
 - From the 'Severity' drop-down menu, select Clear, Indeterminate, Warning, Minor,
 Major or Critical. All alarms whose severity level match your selection will be displayed.
 - From the 'Acknowledged' drop-down menu, select True (the default is False). All acknowledged alarms will be displayed.
 - For the alarm 'Source', enter the node name or the Peer Connection name, if you know it. All alarms originating from that source will be displayed.
 - In the 'Description' field, enter a key word used to describe the alarm.
 - Select either Between Times, Last 24 hours, Last week or Last 30 days. All alarms whose timestamp matches your selection will be displayed.
- 3. Click Search.

Enriching Routing Rule Matching Notifications with ARM Information

In addition to supporting notification on a call matching a specific rule, the ARM also allows operators to *customize information provided with the notification*. The feature - notification sent on a call matching a rule - is usually applied for emergency calls such as 911 calls. The notifications usually require additional information such as user name, building, floor, country or office branch name. This information is not part of the SIP INVITE message but it can be added to the ARM users database and used for additional information in notifications.

- > To implement the feature, follow this procedure:
 - Add the corresponding Property Dictionary property (**Users** > **Property Dictionary**) to the ARM's Users table and add the information to these columns; this data will be used as the additional information in generated notifications. See Adding a Property Dictionary to the ARM on page 94 for more information.
- Customize the notification in the 'Routing Rule match' screen (Alarms > Advanced > Routing Rule match) as described below.
- > To enrich routing rule matching notifications with ARM information:
- Open the 'Routing Rule match' screen (Alarms > Advanced > Routing Rule match) to customize the notification.

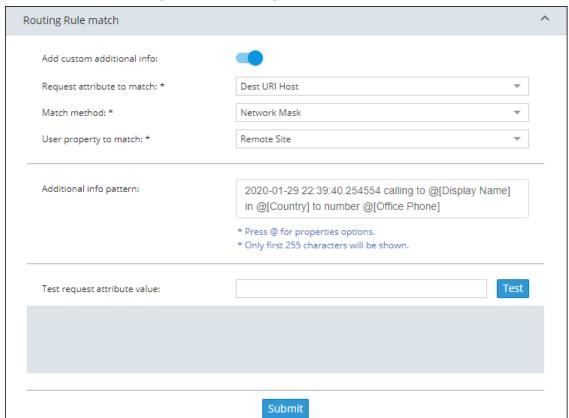

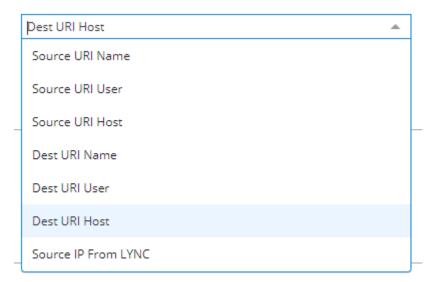

Figure 15-7: Routing Rule match

- Enable the feature using parameter 'Add custom additional info'.
- **3.** Define the notification in the uppermost screen section relating to matching and in the middle screen section displaying parameter 'Additional info pattern' shown in the preceding figure.
 - The uppermost screen section relating to matching is used to identify the exact row (the exact record) in the Users table to be used to extract additional information for the notification. It includes:
 - Request attribute to match. Defines which SIP INVITE message property will be used as the matching criteria. The information is taken by the ARM Router from

the SIP message and used to find the corresponding row in the Users table. Operators can select one of the following options from the drop-down:

Figure 15-8: Request attribute to match: SIP INVITE message properties

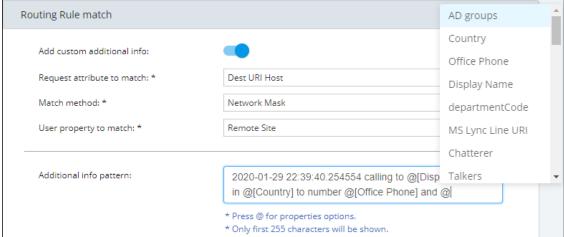

- Match method. Defines how to look for the corresponding entry in the Users table. Available values are Full (for an exact match), Contains (for the Users table value to contain the SIP message field) or Network Mask (for the value of the subnet mask).
- User property to match. Defines one of the properties (available in the ARM Users table) to be used for matching; the operator can select any property from the Property Dictionary.

In the preceding example, the Routing Rule match criteria are configured to make the following match:

If the IP address is taken from 'Dest URI Host' of the SIP Invite message belonging to the subnet (the matching method 'Network Mask') defined in the 'Remote Site' property of the ARM Users table, it will be considered as a match and this row in the Users table will be used for 'Additional info pattern'.

Using parameter 'Additional Info pattern', the operator defines information (and format) to be added as 'Additional Info 2' in the notification. This information is taken from the Users table (per matching row). The information to be presented is formatted using the @ symbol after which the operator can select a specific property:

Figure 15-9: Add custom additional info

- Use the 'Test request attribute value' field shown in the figure below to test the definition.
 - Enter any potential value for 'Request attribute to match' (that can potentially be received in the appropriate SIP header) and thereby validate the required definitions.
 - This is the pattern that will be displayed in 'Additional Info 2' in a real notification in the case of a real call.

Routing Rule match Add custom additional info: Request attribute to match: * Dest URI Host Match method: * Network Mask Remote Site User property to match: * Additional info pattern: @[Display Name] calling from @[Country] with number @[Office Phone] * Press @ for properties options. * Only first 255 characters will be shown. Test request attribute value: 10.10.9.8 Test Texas site calling from USA with number +1123456789 Submit

Figure 15-10: Test request attribute value

If there is no match, the message shown in the figure below is displayed:

Figure 15-11: No user info found

16 Migrating Device Routing to the ARM

Existing device routing can be migrated to the ARM.

- Familiarity is assumed with the AudioCodes device whose routing is to be migrated to the ARM. See Related Documentation for references to AudioCodes' device documentation.
- The screenshots shown here are of Web interface version 7.2. If you're using Web interface version 7.0 or earlier, refer to earlier versions of this document.

AudioCodes Device Application Types

Before migrating device routing to the ARM, it's best to first get acquainted with the routing logic of AudioCodes' device application types. The routing logic of the three AudioCodes device application types are described:

- SBC device application
- Gateway device application
- Hybrid device running both a Getaway application and an SBC application

ARM Network Routing Logic

AudioCodes device's routing logic is centralized in its local routing table independently of the ARM. The SBC's routing logic is centralized in the IP-to-IP Routing Table. The Gateway's routing logic is centralized in the Tel-to-IP and IP-to-Tel routing table.

To integrate a device into the ARM network, the routing logic must be migrated to the ARM so that:

- All calls will be routed by the ARM.
- If a device disconnects from the ARM, calls will be managed by the device's internal routing table.
- If the ARM cannot find any route that matches a specific call, the call will be managed by the device's internal routing table.
- If the device fails to establish a call according to the ARM's routing directive (for example, a SIP error is received), the call will be discontinued.

SBC Routing Logic

AudioCodes' SBC routes and handles IP-to-IP calls. The SBC routing logic is centralized in the IP-to-IP Routing Table. For the ARM to route calls, you must configure a related routing rule in the SBC's internal IP-to-IP Routing Table as described in Migrating SBC Routing to the ARM on page 216.

Gateway Routing Logic

AudioCodes' Media Gateway routes and handles IP-to-Tel, Tel-to-IP and Tel-to-Tel calls using an internal loopback IP Group.

Gateway routing logic is configured in the device's internal IP-to-Tel and Tel-to-IP tables. To migrate the gateway application's routing logic to the ARM network, you must set the routing parameter 'Gateway Routing Server' to Enable. When this configuration is applied in the gateway, all its routing goes through the ARM and internal routing configuration is ignored.

Hybrid Device Routing Logic

The ARM routes calls from the hybrid device's PSTN (gateway application) to IP (SBC application) or vice versa.

Calls cannot be routed from an IP Group (PCon in ARM) associated with a gateway application, to an IP Group associated with an SBC application on the same hybrid device.

To support a hybrid device, two internal IP Groups must be configured:

- From the SBC application to the Media Gateway application
- From the Media Gateway application to the SBC application

The ARM GUI does not display these two internal IP Groups. Routing is performed per the logic described under SBC Routing Logic on the previous page and Gateway Routing Logic above, respectively.

See Migrating Hybrid Routing to the ARM on page 222 for information about how to migrate hybrid device routing to the ARM.

Connecting the Device to the ARM Topology Server

You need to connect the device to the ARM Topology Server.

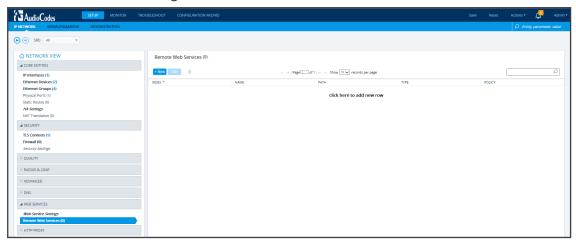

AudioCodes recommends starting a migration by manually adding a device in the ARM Network page as shown in Adding an AudioCodes Node to the ARM on page 51.

For auto-discovery provisioning, take the steps below to connect the device to the ARM network.

> To connect the device:

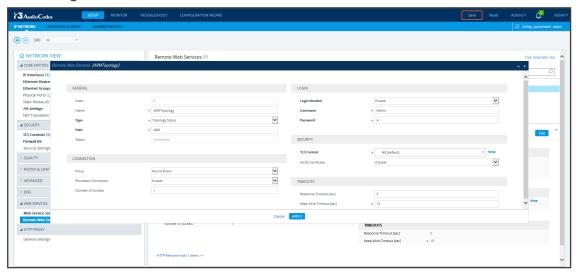

- In your internet browser, enter the device's IP address in the Address bar, and then in the login page that opens, enter the User Name and Password (Admin, Admin are the defaults).
- In the device's Web interface that opens, check the Setup menu and then navigate to the HTTP Remote Services page (IP Network > Web Services > Remote Web Services).

Figure 16-1: Services

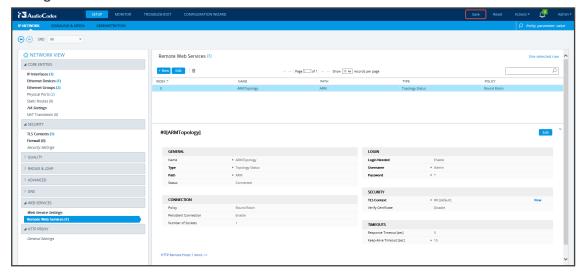

3. Click +New or click here to add new row.

Figure 16-2: Web Interface - HTTP Remote Services - Add Row

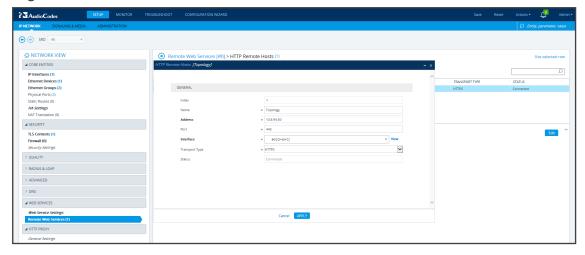

4. Configure the dialog using the figure above as reference, and click **Apply**.

Figure 16-3: Web Interface - Remote Web Services - HTTP Remote Hosts

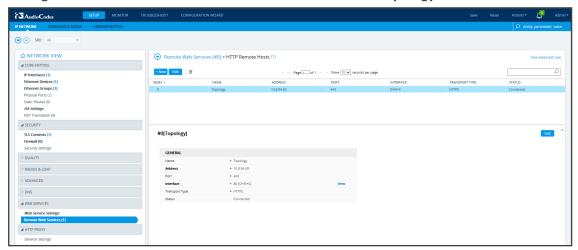

- 5. Click the HTTP Remote Hosts link shown in the figure above.
- **6.** In the HTTP Remote Hosts page that opens, click the **Add** tab.

Figure 16-4: Web Interface - Remote Web Services - HTTP Remote Hosts - Add

7. Define the IP Address of the ARM Topology Server to which you want to point the device and define the ARM Topology Server settings, and then click **Save**; wait until connected.

Figure 16-5: Web Interface - Device Connected to ARM Topology Server

- **8.** Make sure in the Remote Web Services HTTP Remote Hosts screen shown in the figure above that the status of the host, i.e., of the ARM Topology Server, is **Connected**.
- **9.** Connect to the router/s.

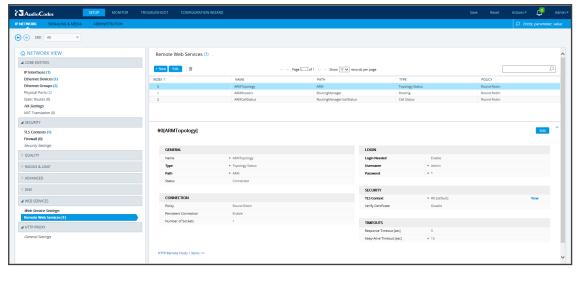

Figure 16-6: Web Interface - Remote Web Services - Routers

10. Make sure that the device is connected to all HTTP ARM services i.e., ARM Topology Server and router/s, as shown in the figure above.

Defining an IP Interface Dedicated to ARM Traffic

ARM version 7.8 and nodes (SBC or Gateway) version 7.20A.154.044 and later support the capability to define on AudioCodes devices additional IP interfaces for management on any application type (Media and/or Control, not OAMP) and different TLS contexts for each IP interface.

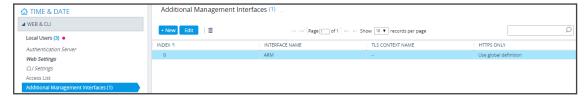

Defining a dedicated IP interface on the device for ARM traffic allows keeping ARM traffic internal, if required, separating ARM traffic from other device management traffic such as Web, SNMP and NTP.

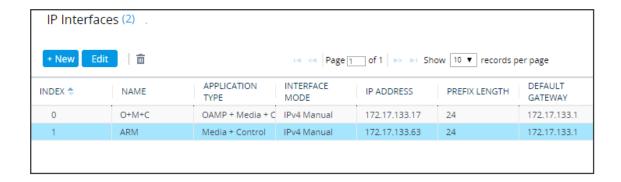

When defining ARM on the node, you must assign an IP interface to the remote host (ARM) and a TLS context for the HTTP Service. The ARM automatically adds its routers to all nodes. When the ARM does this, it uses the same IP interface and TLS context that you defined for the ARM Configurator HTTP Service. If either the IP interface or the TLS context of the ARM Configurator will be changed, the ARM will synchronize the new values to the ARM routers.

To provide an AudioCodes device with a dedicated ARM interface:

Connect to the device's Web interface and in the Web interface, navigate to Administration > Web & CLI > Additional Management Interfaces. Configure an additional IP interface for device routing management as shown in the following figure.

Figure 16-7: Additional Management Interfaces

Migrating SBC/Gateway/Hybrid Routing to the ARM

AudioCodes devices can be migrated to the ARM network. After making sure that the device is connected to all HTTP ARM services i.e., ARM Topology Server and router/s, you can begin to migrate the routing logic from that configured in the device, to the ARM. The screenshots shown here are for illustrative purposes. The changes described here are the general changes that must be made.

➤ To migrate an AudioCodes device to the ARM network:

- Configure IP Groups and SIP interfaces used by the ARM:
- In the device's Web interface, navigate to the SIP Interface Table Page (Setup > Signaling & Media > Core Entities > SIP Interfaces).
- Navigate to the SIP Interface Table Page (Setup > Signaling & Media > Core Entities > SIP Interfaces).
- 3. Locate the SIP Interface to expose the enterprise network to the ARM environment.

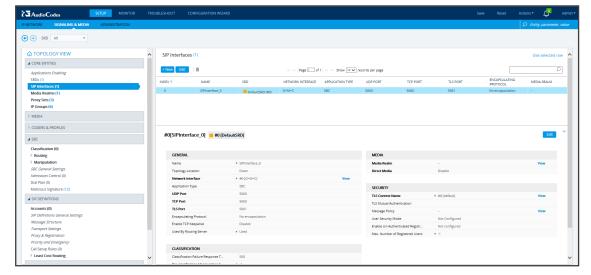

Figure 16-8: Web Interface – SIP Interfaces

~

~

~

Not Configured

~

Figure 16-9: Web Interface - SIP Interfaces Table - Configuring a SIP Interface

- 4. Set the 'Used by Routing Server' parameter to **Used**.
- 5. Click Save.

Migrating SBC Routing to the ARM

SBC routing can be migrated to the ARM network. After making sure the SBC is connected to all HTTP ARM services i.e., ARM Topology Server and router/s, you can begin to migrate the routing logic from that configured in the SBC, to the ARM. The screenshots shown here are for illustrative purposes only.

- See also Checklist for Migrating SBC Routing to the ARM on page 226.
- 'IP Group' and 'Trunk Group' in the Web are called 'Peer Connection' in the ARM.

> To migrate routing logic to the ARM:

- In the Web interface, navigate to the IP Groups page (Setup > Signaling & Media > Core Entities > IP Groups).
- 2. Locate the IP Group to expose the enterprise network to the ARM environment. Make sure the SIP interface associated with this IP Group is configured as 'used by routing server'. See Migrating SBC/Gateway/Hybrid Routing to the ARM on the previous page.

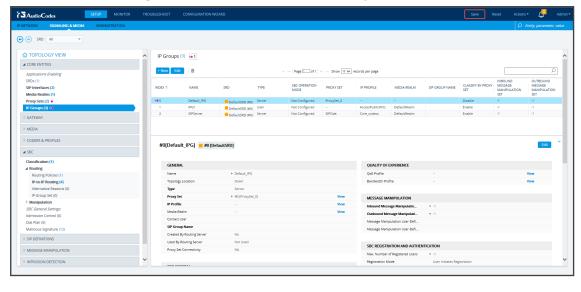

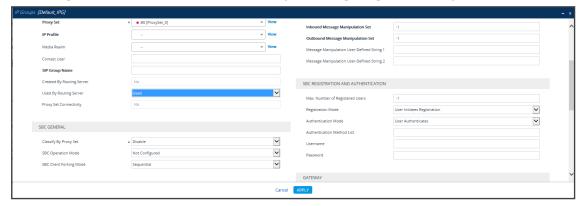

Figure 16-10: Web Interface - IP Groups

Figure 16-11: Web Interface - IP Groups - Configuring an IP Group

- 3. [Mandatory] Enter a unique name for the IP Group.
- 4. [Mandatory] Set the 'Used by Routing Server' parameter to Used.
- 5. Click Save.
- 6. In the ARM GUI, make sure the device is displayed in the Network page, Map view. Verify that the peer connection you configured is displayed. Unlock it and make sure its color is green (see VoIP Peer Information and Actions on page 33).

After configuring an IP group and then viewing it in the ARM, it is strongly recommended not to change its unique name. Changing its unique name will prevent routing by the ARM of calls to this Peer Connection (IP group) and receipt by the ARM of calls from this Peer Connection (IP group).

7. In the Web interface, open the IP-to-IP Routing page (Setup > Signaling & Media > SBC > IP-to-IP Routing). The screen below shows an example of two routing rules.

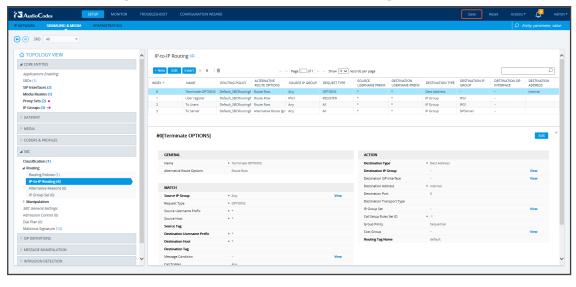

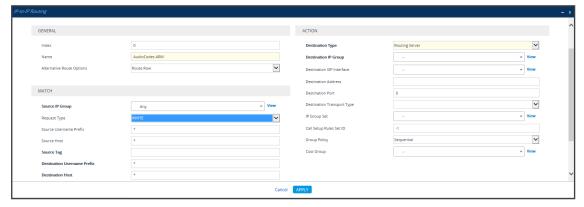

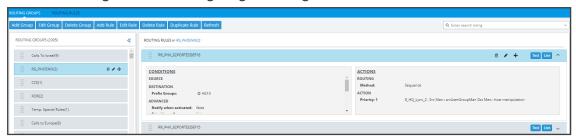

Figure 16-12: Web Interface - IP-to-IP Routing

Figure 16-13: Web Interface – IP-to-IP Routing Table – Add Row – Rule tab

- 8. Define a 'Name' and for 'Request Type', define INVITE (see Configuring an SBC to Send SIP Requests other than INVITE to ARM on page 235 if you need to use the ARM to route other SIP Request Types such as MESSAGE or NOTIFY). Leave all other conditions fields undefined (i.e., No Conditions, or Any).
- **9.** From the 'Destination Type' drop-down menu, select **Routing Server**. This rule will serve to perform routing via the ARM.
- 10. Leave all other fields undefined, and then click Add.
 - At this point, your routing service will still be operating according to that defined in the IP-to-IP Routing page in the SBC's Web interface.
- **11.** In the ARM GUI's Routing page, configure a rule parallel to one of the rules configured in the Web interface's IP-to-IP Routing page (see Adding a Routing Group on page 163).

Figure 16-14: Configuring a Routing Rule in the ARM

- 12. In the ARM GUI, switch Live the routing rule; rule is now activated in the ARM.
- **13.** In the Web interface, delete the routing rule. The transition is now complete.
- **14.** Perform a Test Route (see Testing a Route on page 192 for detailed information).
- **15.** Make a call and make sure it was established by the ARM.

Configure manually using the ini file, or in the Web interface's 'Admin' page, configure 'SendAcSessionIDHeader' = 1 for the SBC/Gateway to preserve the Call ID when a call passes through multiple SBCs/Gateways.

See also Checklist for Migrating SBC Routing to the ARM on page 226.

Migrating Media Gateway Routing to the ARM

After making sure that the device (the gateway in this case) is connected to all HTTP ARM services i.e., ARM Topology Server and router/s, you can begin to migrate the routing rules from those defined in the Web interface to the ARM. Screenshots are for illustrative purposes.

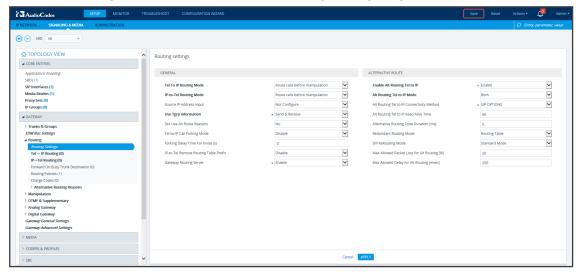

'Trunk Group' and 'IP Group' in the Web are called 'Peer Connection' in the ARM.

> To migrate gateway routing rules to the ARM:

1. In the Web interface, navigate to the Routing Settings page, and set the parameter 'Gateway Routing Server' to **Enable**.

Figure 16-15: Web Interface - Routing Settings Page

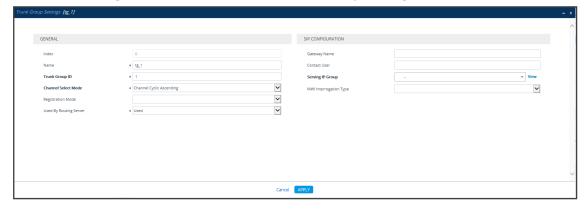

- 2. Navigate in the Web interface to the IP Groups page.
- 3. Locate the IP Group to expose the enterprise network to the ARM environment.
- 4. [Mandatory] Enter a unique name for the IP Group as shown in the following figure.
- 5. Set the 'Used by Routing Server' parameter to **Used** as shown in the following figure, and then click **Apply**.

Index

Figure 16-16: Web Interface - IP Groups Page

- 6. Navigate to the Trunk Group Settings page (Setup > Signaling & Media > Gateway > Trunk Group Settings) shown in the following figure.
- 7. Locate the Trunk Group to expose the enterprise network to the ARM environment.
- 8. [Mandatory] Enter a unique name for the Trunk Group.
- 9. Set the 'Used by Routing Server' parameter to **Used**, and then click **Apply**.

Figure 16-17: Web Interface - Trunk Group Settings

10. In the ARM GUI, make sure the device is displayed in the Network page, Map view. Make sure the Peer Connection you configured is displayed. Unlock it and make sure its color is green.

After viewing the trunk group or IP Group in the ARM, it is strongly recommended not to change its unique name. Changing its unique name will prevent routing by the ARM of calls to this Peer Connection (trunk / IP group) and receipt by the ARM of calls from this Peer Connection (trunk / IP group).

At this point, your routing service will still be operating per that defined in the Tel-to-IP Routing and IP-to-Tel Routing pages in the gateway's Web interface.

In the ARM GUI's Routing page, configure a rule parallel to one of the rules configured in the Web interface's Tel-to-IP Routing or IP-to-Tel Routing pages.

- **11.** Unlock the configured gateway Routing Rule in the ARM and check using the Test Route feature that the rules are functioning as required.
- **12.** Delete the parallel rules configured in the Web interface's Tel-to-IP Routing or IP-to-Tel Routing pages.

Migrating Hybrid Routing to the ARM

After making sure that the hybrid device is connected to all HTTP ARM services i.e., ARM Topology Server and router/s, you can begin to migrate the routing rules from those defined in the Web interface to the ARM.

> To migrate hybrid routing rules to the ARM:

- 1. Perform migration of the SBC per the instructions in Migrating SBC Routing to the ARM on page 216.
- 2. Perform migration of the Media Gateway per the instructions in Migrating Media Gateway Routing to the ARM on page 220.
- 3. Open the hybrid device's Web interface.
- 4. Create an IP Group (Peer Connection) for the SBC application:
 - a. Open the Proxy Sets page (Setup > Signaling & Media > Core Entities > Proxy Sets) and then add a Proxy Set for the SBC application:

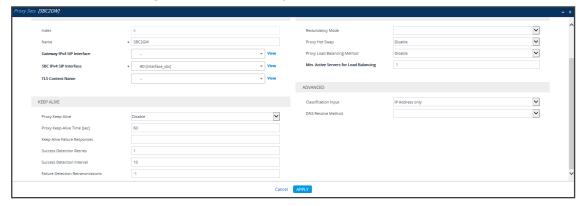

Figure 16-18: Add Proxy Set – for SBC

b. From the 'SBC IPv4 SIP Interface' drop-down menu, select SBC SIP Interface and then click Apply; the Proxy Sets page opens showing the list of proxy sets, including the proxy set you added.

| Company | Comp

Figure 16-19: Proxy Sets

5. From the Proxy Sets list shown in the figure above, select the proxy set you added and then click the Proxy Address link.

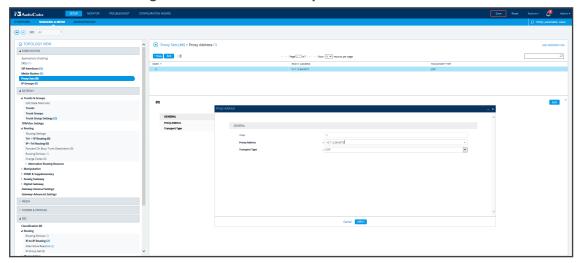

Figure 16-20: Add New Proxy Address

- a. Enter the Proxy IP Address in the format <IPAddress>:Port. This address must point to the Gateway SIP interface address so a loop between the SBC SIP application and the Gateway SIP application is created.
- b. Open the IP Groups page (Setup > Signaling & Media > IP Groups), add an IP Group (click New) and associate it with the Proxy Set you added in Step 4a.

Figure 16-21: IP Group for the SBC Application

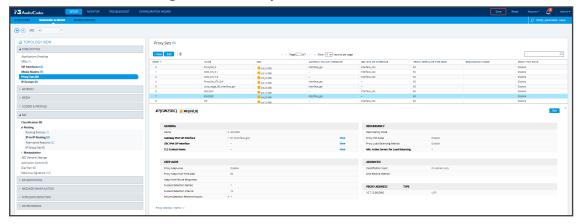

- 6. Create an IP Group (Peer Connection) for the Media Gateway application:
 - a. Open the Proxy Sets page (Setup > Signaling & Media > Core Entities > Proxy Sets) and then add a Proxy Set (click New) for the Media Gateway application:

Figure 16-22: New Proxy Set for Media Gateway Application

b. Select **Gateway SIP Interface** from the 'Gateway IPv4 SIP Interface' drop-down menu and then click **Apply**; the Proxy Sets page opens showing the list of proxy sets, including the proxy set you added.

Figure 16-23: Proxy Sets

7. From the Proxy Sets list shown in the figure above, select the proxy set you added and then click the Proxy Address link.

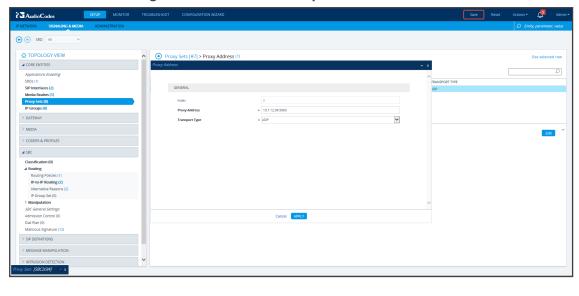

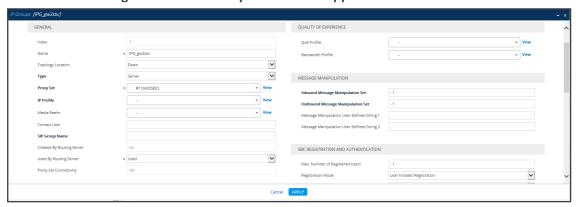

Figure 16-24: Add New Proxy Address

- a. Enter the Proxy IP Address in the format <IPAddress>:Port. This address must point to the SBC SIP interface address so a loop between the Gateway SIP application and the SBC SIP application is created.
- b. Open the IP Groups page (Setup > Signaling & Media > IP Groups), add an IP Group (click New) and associate it with the Proxy Set you added:

Figure 16-25: IP Group for the SBC Application

8. Click **Apply**. Check in the ARM that calls can be routed to and from the hybrid device.

17 Checklist for Migrating SBC Routing to the ARM

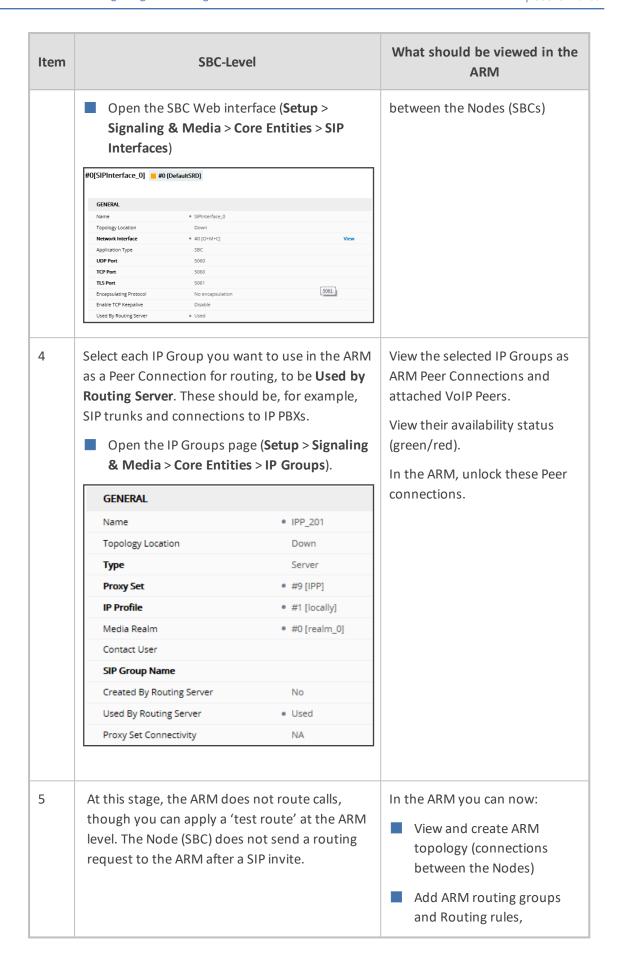

Administrators can use the checklist shown in the following table when migrating SBC routing to the ARM. Tick off the items in the list as you proceed.

The screen shots shown here are of Web interface version 7.2. If you're using Web interface version 7.0 or earlier, refer to earlier versions of this document.

Table 17-1: SBC Migration Checklist

Item	SBC-Level	What should be viewed in the ARM
1	Configure the SBC in the way you used to, including all the IP Groups for connectivity with external SIP trunks and PBXs.	Unrelated to ARM
2	Configure the IP address of the ARM's 'Configurator' Note: Do not configure Routers independently. Only configure 'Configurator' IP address and credentials: Configure in the SBC's Web interface (Setup > IP Network > Web Services > Remote Web Services): IP address of the Configurator User name and Password for connecting to the Configurator. Default: Admin/Admin	View the new Node. Make sure it becomes green- coded, indicating that it's avail- able.
	#O[ARMTopology] GENERAL Name	
3	Choose the SIP interfaces you want to use in the ARM (for ARM Peer Connections and ARM Connections) to be 'Used by Routing Server'.	You're able to select the chosen SIP Interfaces as ARM 'Routing Interfaces' for ARM Connections

Item	SBC-Level	What should be viewed in the ARM
		manipulation groups, etc. Test yourself using the ARM's 'test route'
6	Command the SBC to route calls using the ARM: Open the SBC Web interface IP-to-IP Routing (Setup > Signaling & Media > SBC > IP-to-IP Routing). Make sure the rule that routes all INVITE requests to the ARM is configured. The following parameters are mandatory: 'Request Type' = INVITE; 'Destination Type' = Routing Server.	Calls are now routed by the ARM: SBC gets an INVITE Sends routing Request to ARM Get reply from ARM Sends INVITE further according to the ARM's instructions
7	Configure manually using the ini file (or in the 'Admin' Web interface page): SendAcSessionIDHeader = 1	Causes the SBC to preserve Call ID when a call passes through several SBCs.

CHAPTER 18 Prefixes ARM | User's Manual

18 Prefixes

Use the following table as reference when defining prefixes. $% \label{eq:control_eq} % \label{eq:con$

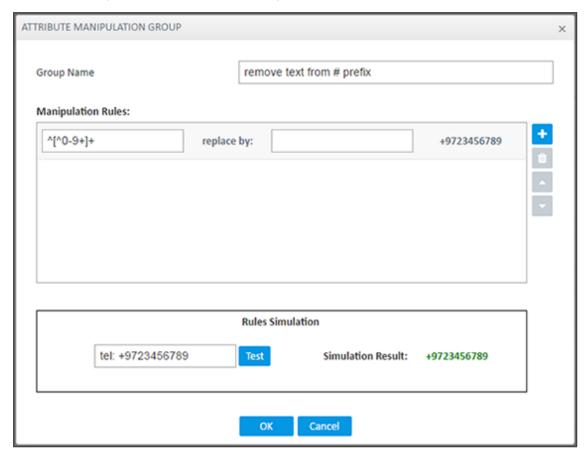

Table 18-1: Prefixes

Notation	Description	Examples
[n-m]	Represents a range of numbers. Note: numbers "n" and "m" should be of the same length.	[5551200-5551300]#: represents all numbers from 5551200 to 5551300. 123[100-200]: represents all numbers from 123100 to 123200.
[n,m,] or n,m,l,	Represents multiple numbers or strings.	[2,3,4,5,6]#: represents a one-digit number starting with 2, 3, 4, 5, or 6. [11,22,33]XXX#: represents a five-digit number that starts with 11, 22, or 33. [111,222]XXX#: represents a six-digit number that starts with 111 or 222. [2X,3X,4X,50,54]XXXXXXX#: represents a 8 digit number starting with 2, 3, 4, 50 or 54 aaa,bbb,ce,field: represents names that start with one of the strings: aaa, bbb, ce or field.
[n1-m1,n2-m2, a,b,c,n3-m3]	Represents a mixed notation of multiple ranges and single numbers.	[123-130,455,766,780-790]: represents numbers 123 to 130, 455, 766, and 780 to 790.
X (capital only)	Represents any single digit or character.	BobX: represents names starting with bob1 or bob2@audiocodes.com AliceX#: represents names of 6- character length, starting with Alice, such as Alice1.
Pound sign (#) at the end of a number	Represents the end of a number.	54324XX#: represents a 7-digit number that starts with 54324.
Empty	Represents any number or string	

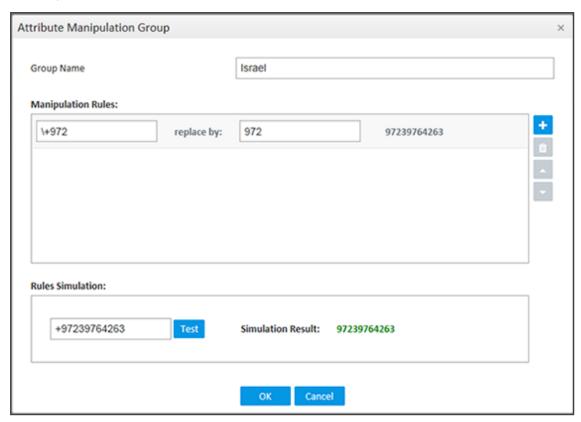

19 Examples of Normalization Rules

Here are some examples of Normalization Rules and regular expressions for your reference.

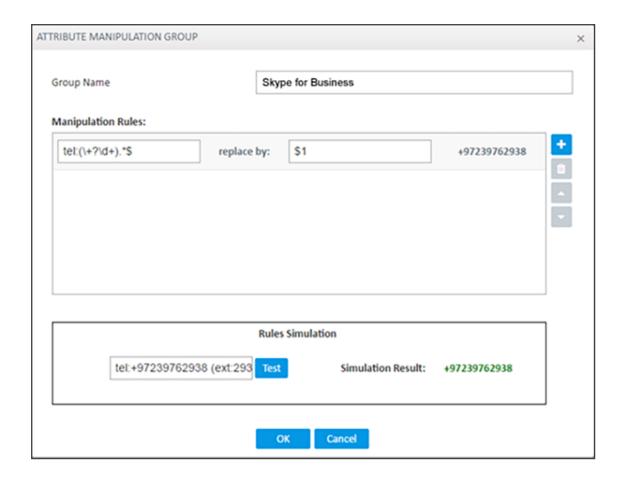

Remove any non-number text from the prefix of the number:

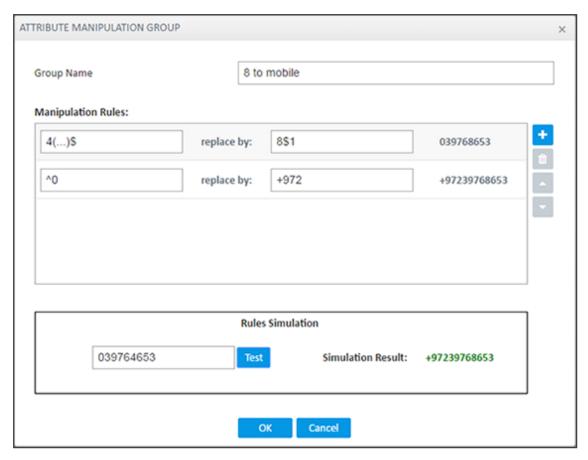

Strip the + from the number.

Skype for Business: Remove "tel:" from the prefix and any text from the number's suffix. In the **Test** field, the full number is tel:+97239762938 (ext:2938).

If the fourth digit from the right is **4**, change it to **8**, and if the first digit is **0**, change it to **+972**.

Click **OK** and then click **Submit**.

CHAPTER 20 Call Routing ARM | User's Manual

20 Call Routing

The following describes call routing:

- A routing request results in an HTTP error response if no routing is available.
- A routing request from a source node which has an alternate route option returns the next alternate route option. The call route is not recalculated. If the alternate route list is empty, a 404 result is returned.
- A routing request from a node which is not the source node returns the next hop in the routing chain according to the original route selection. The routing logic is not performed again.

21 Configuring an SBC to Send SIP Requests other than INVITE to ARM

The SBC can be configured to send MESSAGE and NOTIFY SIP requests to the ARM. To get not only INVITE but also NOTIFY and MESSAGE, create a new Condition in the Condition table with the value: "header.request-uri.methodtype == '5' or header.request-uri.methodtype == '13' or header.request-uri.methodtype == '14'".

> To configure the SBC to send SIP Requests other than INVITE to the ARM:

 Open the Message Conditions page (Setup > Signaling & Media > Message Manipulation > Message Conditions) and click Add.

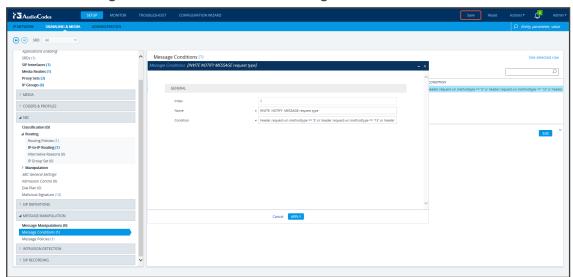

Figure 21-1: Web Interface – Message Conditions

- 2. Add the condition as shown in the figure above, and click Apply.
- Open the IP-to-IP Routing page (Setup > Signaling & Media > SBC > Routing > IP-to-IP Routing), select the row of the Routing Rule that directs calls to the ARM, and click Edit.

Figure 21-2: Web Interface – IP-to-IP Routing

- 4. Edit the Routing Rule (see the preceding figure):
 - Change 'Request Type' from Invite to All.
 - Select the 'Message Condition' you configured.

- 5. Click Apply.
- 6. Make a call and make sure the call was established by the ARM.

Configure manually using the ini file, or in the Web interface's 'Admin' page, configure 'SendAcSessionIDHeader' = 1. Note that this step is temporary and that a permanent solution is pending. It causes the SBC/Gateway to preserve Call ID when a call passes through several SBC/Gateways.

Opening Firewall Ports for the ARM

Ports for the ARM must be opened in the Firewall. Use the following table as reference.

Table 22-1: Opening Firewall Ports for the ARM

Connection	Port Type	Secured Connectio n	Port Number	Purpose	Port side / Flow Direction		
ARM and Devices	ARM and Devices (SBCs / Gateways / Hybrid nodes)						
Device ↔ ARM Configurator (REST)	TCP (HTTP S) - default	✓	443	Topology Auto- discovery, Topology Status update, Quality information, long call sessions information (for licensing)	Bi- Directional		
	TCP (HTTP) – debug only	x	80	Topology Auto- discovery, Topology Status update, Quality information, long calls session information (for licensing)	Bi- directional		
Device ↔ ARM Router (REST)	TCP (HTTP S) - default	√	443	Routing requests and calls status	Bi- Directional		
	TCP (HTTP) – debug only	×	80	Routing requests and calls status	Bi- directional		

Connection	Port Type	Secured Connectio n	Port Number	Purpose	Port side / Flow Direction		
ARM and LDAP A	ARM and LDAP Active Directory Server						
ARM Configurator	TCP (LDAP)	×	389 (Default, can be configured at ARM)	Getting of ARM AD users and updating ARM user database	Bi-direction al		
	TCP (TLS - LDAPS)	√	636 3268 for 'Global catalog' Default, can be configured at ARM)	Getting of ARM AD users and updating ARM user database LDAPS (TLS) is configured at ARM	Bi-direction al		
ARM GUI and No	rth bound	Interface					
UI (REST communication) → ARM Configurator	TCP (HTTP S)	√	443	ARM component status updates, GUI, Provisioning, Alarms indications	Incoming (from ARM Configurato r perspective)		
Third-party application (via official REST API) → ARM Configurator	TCP (HTTP S)	✓	443	ARM component status updates, GUI, Provisioning, Alarms indications	Incoming (from ARM Configurato r perspective)		
ARM Configurator → SNMP Target	UDP (SNM P)	×	161, 162 or configurabl e	ARM generates SNMP traps/alarms toward predefined SNMP Target.	Outgoing		

Connection	Port Type	Secured Connectio n	Port Number	Purpose	Port side / Flow Direction		
ARM Managemer	ARM Management / Maintenance Interfaces						
ARM Configurator ↔ NTP Server	UDP (NTP server)	x	123	ARM Configurator acts as NTP client toward external (pre- configured) NTP server. It also acts as NTP Server toward ARM Routers.	Bi- directional		
ARM Router → NTP Server (ARM Configurator)	UDP (NTP)	×	123	ARM Router acts as NTP client	Outgoing		
ARM Configurator ↔ Client PC (SSH)	ТСР	✓	22	SSH communicatio n between ARM Configurator and external PC initiated by client PC: For ARM maintenance	Bi- directional		
ARM Router Client PC (SSH)	ТСР	√	22	SSH communicatio n between ARM Router and external PC initiated by client PC: For ARM maintenance	Bi- directional		
ARM	ТСР	×	514 (by	ARM	Outgoing		

Connection	Port Type	Secured Connectio n	Port Number	Purpose	Port side / Flow Direction
Configurator → Syslog server			default) or configurabl e	Configurator logs can be forwarded to external syslog server.	
ARM Router → Syslog server	ТСР	×	514 (by default) or configurabl e	ARM Routers logs can be forwarded to external syslog server.	Outgoing
ARM Inter-Comp	onents Cor	nmunication (Configurator (:	→ Routers)	
ARM Configurator ↔ ARM Routers	TCP (HTTP S)	√	443	Getting call statistics from the ARM Configurator; getting call sessions information for ARM licensing	Bi- directional
	TCP (HTTP) -debug only	×	80	Getting call statistics from the ARM Configurator; getting call sessions information for ARM licensing	Bi- directional
ARM Configurator ← JMS Broker	TCP (TLS)	√	8080	Informing ARM Routers about topology changes (including topology status and	Incoming

Connection	Port Type	Secured Connectio n	Port Number	Purpose	Port side / Flow Direction
				quality changes)	
ARM Router → JMS Broker	TCP (TLS)	√	8080	Getting Topology updates from ARM	Outgoing

23 About CDRs Sent by ARM to CDR Server

ARM Routers send CDRs (Call Detail Records) to a CDR Server. CDR messages contain information about all calls routed by the ARM, for example, source and destination users, call duration and call path. CDR messages also provide billing details. CDRs are sent as syslog packets to a predefined IP address configured by the operator. CDR syslog messages comply with RFC 3164 and are identified by Facility 17 (local1) and Severity 6 (Informational). CDR messages are built using getRoute and CallStatus_callEnd messages, by the first node in the paths. CDR types are CALL START and CALL END.

Calls from an SBC node:

- 1. One CALL_START message is sent per route (path)
- 2. Two CALL END messages are sent at the end of the call

Calls from a gateway node:

- 1. One CALL_START message is sent per route (path)
- 2. One CALL_END message is sent at the end of the call (not per route)

SessionId is identical for all CDR messages related to the same call.

The routeSeq:

- 1. Represents the route (path) the ARM attempts
- 2. The count starts from 0
- 3. For example, for an SBC call, when there are three paths to attempt, the ARM sends:
 - **a.** First route (path): One CALL_START message and one CALL_END (outgoing leg) message. routeSeq = 0.
 - b. Second route (path): One CALL_START message and one CALL_END (outgoing leg) message. routeSeq = 1.
 - c. Third route (path): One CALL_START and two CALL_END (incoming and outgoing legs) messages. routeSeq = 2.

The following table describes all CDR fields.

Table 23-1: CDR Field Descriptions

CDR Field	Description	CDR Report Type	Format
RouterIp	IP address of the Router that sends the CDR.	All	String (15)
Seq	Each router sends its own sequence CDR staring with 1.	All	String (10)

CDR Field	Description	CDR Report Type	Format
CreationDate	The creation date of the CDR.	All	String (40)
CdrReportType	Report type: "CALL_START": CDR is sent upon an getRoute message on the first node. "CALL_END": CDR is sent upon a CALL_STATUS_ END_CALL message from the node.	-	String (13)
АррТуре	Endpoint type: "SBC" "GW" "HYBRID" "THIRD_PARTY"	All	String (13)
SessionId	Unique Session ID	All	String (20)
callid	Callid of the relevant leg	"CALL_ START" – incoming leg. "CALL_END" – both legs.	String (55)
direction	Direction of the call: Incoming or Outgoing	"CALL_ START"	String (10)
pconOrConnectionName	Pcon or connection name	All	String (35)
nodeld	ARM node database ID address	All	String (11)
nodeName	Node name as described in the GUI	All	String (25)
nodelp	Node IP address	All	String

CDR Field	Description	CDR Report Type	Format
			(20)
pconld	Pcon database ID	"CALL_ START"	String (10)
conId	Connection database ID	"CALL_ START"	String (10)
pconOrConnectionType	Pcon or connection type	"CALL_ START"	String (25)
outPconId	Outgoing Peer Connection database ID	"CALL_ START"	String (10)
outConId	Outgoing Connection database ID	"CALL_ START"	String (10)
outPconOrConType	Outgoing leg type	"CALL_ START"	String (25)
lastNodeId	ID of the last node	"CALL_ START"	String (10)
lastNodeName	Name of the last node	"CALL_ START"	String (25)
lastPconId	ID of the last Peer Connection	"CALL_ START"	String (10)
lastPconName	Name of the last Peer Connection	"CALL_ START"	String (35)
srcUri	Source URI as actually sent (after manipulation).	All	String (50)
srcUriBeforeMap	Source before manipulation.	"CALL_ START"	String (50)
dstUri	Destination URI as actually sent (after manipulation).	All	String (50)
dstUriBeforeMap	Destination before manipulation.	"CALL_ START"	String (50)
armSetupTime	ARM Router time when	"CALL_	String

CDR Field	Description	CDR Report Type	Format
	sending CALL_START.	START"	(30)
armReleaseTime	ARM Router time when sending CALL_END.	"CALL_END"	String (30)
sbcSetupTime	Gateway / SBC time when start handling Invite message.	"CALL_END"	String (40)
sbcConnectTime	Gateway / SBC time when 200 OK response (i.e., call is established)	"CALL_END"	String (40)
sbcReleaseTime	Gateway / SBC time when a BYE message (i.e., call ends)	"CALL_END"	String (40)
sbcAlertTime	Gateway / SBC time when start ringing	"CALL_END"	String (40)
alertDuration	Time of ringing in milliseconds (should be configured in the SBC /gateway to send in milliseconds)	"CALL_END"	String (13)
voiceDuration	Time of voice streamed in milliseconds (should be configured in the SBC /Gateway to send in milliseconds)	"CALL_END"	String (13)
completeDuration	Time of the whole call in milliseconds (from the first incoming Invite until ending the call)	"CALL_END"	String (16)
sipTerminationReason	SIP termination reason	"CALL_END"	String (20)
sipTerminationReasonDesc	SIP termination reason – more detailed	"CALL_END"	String (35)
routeSeq	Each route (path) of a call has a number. Starting from 0.	"CALL_ START"	String (8)
sipInterface	sipInterface ID of the	"CALL_	String

CDR Field	Description	CDR Report Type	Format
	Connection or Peer Connection in the SBC / Gateway	START"	(20)
legId	Leg id of the SBC / Gateway	"CALL_END"	String (11)
routingRuleId	The Routing Rule ID of the match rule	"CALL_ START"	String (13)
routingRuleName	The Routing Rule name of the match rule	"CALL_ START"	String (30)
discardingByRoutingRule	The Routing Rule ID in case of discarding rule	"CALL_ START"	String (24)
Path	String – describes the path.	"CALL_ START"	String (200)

Two CDR format options are available:

- Clear text (separating each value with "|")
- As JSON

Here's an example of an ARM signaling CDR as *clear text*, sent at the end of a call (which was terminated normally):

Format:

|routerlp|seq|creationDate|cdrReportType|appType|sessionId|callId|direction |pconOrConName|nodeId|nodeName|nodeIp|pconId|conId|pconOrConType |sipInterface|outPconId|outConId|outPconOrConType|lastPconId|lastNodeId |lastNodeName|lastPconName|srcUri|srcUriBeforeMap|dstUri|dstUriBeforeMap |armSetupTime|armReleaseTime|sbcSetupTime|sbcConnectTime |sbcReleaseTime|sbcAlertTime|alertDuration|voiceDuration|completeDuration |sipTerminationReason|sipTerminationReasonDesc|routeSeq|legId |routingRuleId|routingRuleName|discardingByRoutingRule|path

Value:

| 10.7.6.102 | 2 | 2019-02-21T08:53:15.123Z | CALL_END | SBC | 7018782a40c69c13 | 75aed8-8802070a-13c4-55013-16cc4-7c2dd6ce-16cc4 | RMT | 102 | 4 | SBC_97 | 10.7.12.97 | null | null | IPGroup | | null | null | IPGroup | null | null | | | 102@10.7.2.136 | |201@10.7.12.97 | | |2019-02-21T08:53:15.116Z | |23:27:10.537 UTC Wed Feb 07 2018 | 23:27:13.554 UTC Wed Feb 07 2018 | |23:27:18.842 UTC Wed Feb 07 2018 | |23:27:10.837 UTC Wed Feb 07 2018 | |2717 | |5288 | |8305 | BYE | BYE | 0 | 1 | -1 | | null | |

Here's an example of an ARM signaling CDR as JSON, sent at the end of a call (that was terminated normally):

```
