|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| x (letter "x")      | Denotes any single digit.                                                                                                                                                                                                                                                                                                                                                                                         |
| # (pound symbol)    | <ul style="list-style-type: none"> <li>When used at the end of a prefix, it denotes the end of a number. For example, <b>54324xx#</b> represents a 7-digit number that starts with the digits 54324.</li> <li>When used anywhere in the suffix, it is part of the number. For example, <b>(3#45)</b> can represent the number string, 123#45.</li> </ul>                                                          |
| * (asterisk symbol) | <ul style="list-style-type: none"> <li>When used in the prefix, it denotes any number.</li> <li>When used in the suffix, it is part of the number. For example, <b>(3*45)</b> can represent the number string, 123*45.</li> </ul>                                                                                                                                                                                 |
| \$ (dollar sign)    | <p>Denotes an empty prefix for incoming IP calls that do not have a user part in the Request-URI, or for incoming Tel calls that do not have a called or calling number. This is used for the following matching criteria:</p> <ul style="list-style-type: none"> <li>Source and Destination Phone Prefix</li> <li>Source and Destination Username</li> <li>Source and Destination Calling Name Prefix</li> </ul> |

#### Range of Digits

##### Notes:

- Dial plans denoting a prefix that is a range must be enclosed in square brackets, e.g., **[4-8]** or **23xx[456]**.
- Dial plans denoting a prefix that is not a range is not enclosed, e.g., **12345#**.
- Dial plans denoting a suffix must be enclosed in parenthesis, e.g., **(4)** and **(4-8)**.
- Dial plans denoting a suffix that include multiple ranges, the range must be enclosed in square brackets, e.g., **(23xx[4,5,6])**.
- An example for entering a combined prefix and suffix dial plan - assume you want to match a rule whose destination phone prefix is 4 to 8, and suffix is 234, 235, or 236. The entered value would be the following: **[4-8](23[4,5,6])**.

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                | <b>Notes:</b> <ul style="list-style-type: none"> <li>The value <math>n</math> must be less than the value <math>m</math>.</li> <li>Only numerical ranges are supported (not alphabetical letters).</li> <li>For suffix ranges, the starting (<math>n</math>) and ending (<math>m</math>) numbers in the range must have the same number of digits. For example, (23-34) is correct, but (3-12) is not.</li> </ul>                                                                                                                                                                                                                                                                                                                                                             |
| [ $n,m,\dots$ ] or ( $n,m,\dots$ )                             | <p>Represents multiple numbers. For example, to depict a one-digit number starting with 2, 3, 4, 5, or 6:</p> <ul style="list-style-type: none"> <li>Prefix: <b>[2,3,4,5,6]#</b></li> <li>Suffix: <b>(2,3,4,5,6)</b></li> <li>Prefix with Suffix: <b>[2,3,4,5,6](8,7,6)</b> - prefix is denoted in square brackets; suffix in parenthesis</li> </ul> <p>For <b>prefix only</b>, the notations <math>d[n,m]e</math> and <math>d[n-m]e</math> can also be used:</p> <ul style="list-style-type: none"> <li>To depict a five-digit number that starts with 11, 22, or 33:<br/><b>[11,22,33]xxx#</b></li> <li>To depict a six-digit number that starts with 111 or 222: <b>[111,222]xxx#</b></li> </ul> <p><b>Note:</b> Up to three digits can be used to denote each number.</p> |
| [ $n1-m1,n2-m2,a,b,c,n3-m3$ ] or ( $n1-m1,n2-m2,a,b,c,n3-m3$ ) | <p>Represents a mixed notation of single numbers and multiple ranges. For example, to depict numbers 123 to 130, 455, 766, and 780 to 790:</p> <ul style="list-style-type: none"> <li>Prefix: <b>[123-130,455,766,780-790]</b></li> <li>Suffix: <b>(123-130,455,766,780-790)</b></li> </ul> <p><b>Note:</b> The ranges and the single numbers used in the dial plan must have the same number of digits. For example, each number range and single number in the dialing plan example above consists of three digits.</p>                                                                                                                                                                                                                                                     |

**Note:** When configuring phone numbers or prefixes in the Web interface, enter them only as digits without any other characters. For example, if you wish to enter the phone number 555-1212, it must be entered as 5551212 without the hyphen (-). If the hyphen is entered, the entry is invalid.

## 57 Configuration Parameters Reference

The device's VoIP functionality (not data-routing functionality) configuration parameters, default values, and their descriptions are documented in this section.

**Notes:** Parameters and values enclosed in square brackets [...] represent the *ini* file parameters and their enumeration values.

### 57.1 Networking Parameters

This subsection describes the device's networking parameters.

#### 57.1.1 Multiple VoIP Network Interfaces and VLAN Parameters

The IP network interfaces and VLAN parameters are described in the table below.

**IP Network Interfaces and VLAN Parameters**

| Parameter                                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 57.1.2 Routing Parameters

The IP network routing parameters are described in the table below.

**IP Network Routing Parameters**

| Parameter                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Static IP Routing Table</b>                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Web/EMS: IP Routing Table<br>CLI: configure voip > static<br><b>[StaticRouteTable]</b> | <p>Defines up to 30 static VoIP IP routing rules for the device. These rules can be associated with IP interfaces defined in the Multiple Interface table (InterfaceTable parameter). The routing decision for sending the outgoing IP packet is based on the source subnet/VLAN. If not associated with an IP interface, the static IP rule is based on destination IP address.</p> <p>When the destination of an outgoing IP packet does not match one of the subnets defined in the Multiple Interface table, the device searches this table for an entry that matches the requested destination host/network. If such an entry is found, the device sends the packet to the indicated router (i.e., next hop). If no explicit entry is found, the packet is sent to the default gateway according to the source interface of the packet (if defined).</p> <p>The format of this parameter is as follows:</p> <p><b>[ StaticRouteTable ]</b><br/> FORMAT StaticRouteTable_Index = StaticRouteTable_InterfaceName, StaticRouteTable_Destination, StaticRouteTable_PrefixLength, StaticRouteTable_Gateway, StaticRouteTable_Description;<br/> <b>[ \StaticRouteTable ]</b></p> <p><b>Note:</b> For a description of this parameter, see 'Configuring Static IP Routing' on page <a href="#">115</a>.</p> |

## 57.1.3 Quality of Service Parameters

The Quality of Service (QoS) parameters are described in the table below.

**QoS Parameters**

| Parameter                                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Layer-2 Class Of Service (CoS) Parameters (VLAN Tag Priority Field)</b>                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Web: DiffServ Table<br>EMS: QoS Settings – DSCP to QoS Mapping<br>CLI: configure voip > vlan-mapping<br><b>[DiffServToVlanPriority]</b> | <p>This table parameter configures DiffServ-to-VLAN Priority mapping. For each packet sent to the LAN, the VLAN Priority of the packet is set according to the DiffServ value in the IP header of the packet. The format of this ini file is as follows:</p> <p><b>[ DiffServToVlanPriority ]</b><br/> FORMAT DiffServToVlanPriority_Index = DiffServToVlanPriority_DiffServ, DiffServToVlanPriority_VlanPriority;<br/> <b>[ \DiffServToVlanPriority ]</b></p> <p>For example:<br/> DiffServToVlanPriority 0 = 46, 6;<br/> DiffServToVlanPriority 1 = 40, 6;<br/> DiffServToVlanPriority 2 = 26, 4;<br/> DiffServToVlanPriority 3 = 10, 2;</p> <p><b>Notes:</b></p> |

| Parameter                                                                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### 57.1.4 NAT and STUN Parameters

The Network Address Translation (NAT) parameters are described in the table below.

#### NAT Parameters

| Parameter                                                                   | Description                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NAT Parameters</b>                                                       |                                                                                                                                                                                                               |
| Web/EMS: NAT Traversal<br>CLI: disable-NAT-traversal<br><b>[DisableNAT]</b> | Enables the NAT mechanism. For more information, see 'First Incoming Packet Mechanism' on page 129. <ul style="list-style-type: none"> <li><b>[0]</b> Enable</li> <li><b>[1]</b> Disable (default)</li> </ul> |
| Web: NAT IP Address<br>EMS: Static NAT IP Address<br>CLI: nat-ip-addr       | Defines the global (public) IP address of the device to enable static NAT between the device and the Internet.<br><b>Note:</b> For this parameter to take effect, a device reset is required.                 |

| Parameter                                                                                            | Description                                                                                                                                                                                                                                                                                                 |
|------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>[StaticNatIP]</b>                                                                                 |                                                                                                                                                                                                                                                                                                             |
| Web/EMS: Inbound Media Latch Mode<br>CLI: inbound-media-latch-mode<br><b>[InboundMediaLatchMode]</b> | <p>Enables the receipt of media streams whose IP address/port are not configured for the channel.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Strict = Accepts only the media stream configured for the channel.</li> <li>▪ <b>[1]</b> Dynamic = (Default) Accepts any media stream.</li> </ul> |

## 57.1.5 NFS Parameters

The Network File Systems (NFS) configuration parameters are described in the table below.

**NFS Parameters**

| Parameter                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLI: base-port<br><b>[NFSBasePort]</b>                     | <p>Defines the start of the range of numbers used for local UDP ports used by the NFS client. The maximum number of local ports is maximum channels plus maximum NFS servers.</p> <p>The valid range is 0 to 65535. The default is 47000.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>NFS Table</b>                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Web: NFS Table<br>EMS: NFS Settings<br><b>[NFSServers]</b> | <p>This table parameter defines up to 16 NFS file systems so that the device can access a remote server's shared files and directories for loading cmp, ini, and auxiliary files (using the Automatic Update mechanism).</p> <p>The format of this table ini file parameter is as follows:</p> <p><b>[NFSServers]</b><br/> FORMAT NFSServers_Index = NFSServers_HostOrIP,<br/> NFSServers_RootPath, NFSServers_NfsVersion,<br/> NFSServers_AuthType, NFSServers_UID, NFSServers_GID,<br/> NFSServers_VlanType;<br/> <b>[NFSServers]</b></p> <p>For example:<br/> NFSServers 1 = 101.1.13, /audio1, 3, 1, 0, 1, 1;</p> <p><b>Note:</b> For a detailed description of this table, see 'Configuring NFS Settings' on page 123.</p> |

## 57.1.6 DNS Parameters

The Domain name System (DNS) parameters are described in the table below.

**DNS Parameters**

| Parameter                                                                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Internal DNS Table</b>                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Web: Internal DNS Table<br>EMS: DNS Information<br>CLI: configure voip ><br>control-network dns<br>Dns2Ip<br><b>[DNS2IP]</b> | This table parameter defines the internal DNS table for resolving host names into IP addresses. Up to four different IP addresses (in dotted-decimal notation) can be assigned to a host name.<br>The format of this parameter is as follows:<br><b>[Dns2Ip]</b><br>FORMAT Dns2Ip_Index = Dns2Ip_DomainName,<br>Dns2Ip_FirstIpAddress, Dns2Ip_SecondIpAddress,<br>Dns2Ip_ThirdIpAddress, Dns2Ip_FourthIpAddress;<br><b>[\Dns2Ip]</b><br>For example:<br>Dns2Ip 0 = DnsName, 1.1.1.1, 2.2.2.2, 3.3.3.3, 4.4.4.4;<br><b>Note:</b> For a detailed description of this table parameter, see 'Configuring the Internal DNS Table' on page <a href="#">120</a> .                                                                                                                                                                     |
| <b>Internal SRV Table</b>                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Web: Internal SRV Table<br>EMS: DNS Information<br>CLI: configure voip ><br>control-network dns<br>Srv2Ip<br><b>[SRV2IP]</b> | This table parameter defines the internal SRV table for resolving host names into DNS A-Records. Three different A-Records can be assigned to a host name. Each A-Record contains the host name, priority, weight, and port. The format of this parameter is as follows:<br><b>[SRV2IP]</b><br>FORMAT SRV2IP_Index = SRV2IP_InternalDomain,<br>SRV2IP_TransportType, SRV2IP_Dns1, SRV2IP_Priority1,<br>SRV2IP_Weight1, SRV2IP_Port1, SRV2IP_Dns2, SRV2IP_Priority2,<br>SRV2IP_Weight2, SRV2IP_Port2, SRV2IP_Dns3, SRV2IP_Priority3,<br>SRV2IP_Weight3, SRV2IP_Port3;<br><b>[\SRV2IP]</b><br>For example:<br>SRV2IP 0 =<br>SrvDomain,0,Dnsname1,1,1,500,Dnsname2,2,2,501,\$\$,0,0,0;<br><b>Note:</b> For a detailed description of this table parameter, see 'Configuring the Internal SRV Table' on page <a href="#">122</a> . |

## 57.1.7 DHCP Parameters

The Dynamic Host Control Protocol (DHCP) parameters are described in the table below.

**DHCP Parameters**

| Parameter                                                   | Description                                                                                                                                                                             |
|-------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Enable DHCP<br>EMS: DHCP Enable<br><b>[DHCPEnable]</b> | Enables Dynamic Host Control Protocol (DHCP) functionality. <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <b>Notes:</b> |

| Parameter                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                             | <ul style="list-style-type: none"> <li>For this parameter to take effect, a device reset is required.</li> <li>After you enable the DHCP server, do the following: <ul style="list-style-type: none"> <li>a. Enable DHCP and save the configuration.</li> <li>b. Perform a cold reset using the device's hardware reset button (soft reset using the Web interface doesn't trigger the DHCP procedure and this parameter reverts to 'Disable').</li> </ul> </li> <li>This parameter is a special 'Hidden' parameter. Once defined and saved in flash memory, its assigned value doesn't revert to its default even if the parameter doesn't appear in the <i>ini</i> file.</li> </ul> |
| EMS: DHCP Speed Factor<br>[DHCPSpeedFactor] | <p>Defines the DHCP renewal speed.</p> <ul style="list-style-type: none"> <li>[0] = Disable</li> <li>[1] = (Default) Normal</li> <li>[2] to [10] = Fast</li> </ul> <p>When set to 0, the DHCP lease renewal is disabled. Otherwise, the renewal time is divided by this factor. Some DHCP-enabled routers perform better when set to 4.</p> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                                        |

## 57.1.8 NTP and Daylight Saving Time Parameters

The Network Time Protocol (NTP) and daylight saving time parameters are described in the table below.

**NTP and Daylight Saving Time Parameters**

| Parameter                                                                                                                                                           | Description                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>NTP Parameters</b><br><b>Note:</b> For more information on Network Time Protocol (NTP), see 'Simple Network Time Protocol Support' on page <a href="#">101</a> . |                                                                                                                                                                                                                                                                                                                  |
| Web: NTP Server DN/IP<br>EMS: Server IP Address<br>CLI: primary-server<br>[NTPServerIP]                                                                             | <p>Defines the IP address (in dotted-decimal notation or as an FQDN) of the NTP server. The advantage of using an FQDN is that multiple IP addresses can be resolved from the DNS server, providing NTP server redundancy.</p> <p>The default IP address is 0.0.0.0 (i.e., internal NTP client is disabled).</p> |
| Web: NTP Secondary Server IP<br>[NTPSecondaryServerIP]                                                                                                              | <p>Defines a second NTP server's address as an FQDN or an IP address (in dotted-decimal notation). This NTP is used for redundancy; if the primary NTP server fails, then this NTP server is used.</p> <p>The default IP address is 0.0.0.0.</p>                                                                 |
| Web: NTP UTC Offset<br>EMS: UTC Offset<br>CLI: utc-offset<br>[NTPServerUTCOffset]                                                                                   | <p>Defines the Universal Time Coordinate (UTC) offset (in seconds) from the NTP server.</p> <p>The default offset is 0. The offset range is -43200 to 43200.</p>                                                                                                                                                 |
| Web: NTP Update Interval<br>EMS: Update Interval<br>CLI: update-interval<br>[NTPUpdateInterval]                                                                     | <p>Defines the time interval (in seconds) that the NTP client requests for a time update.</p> <p>The default interval is 86400 (i.e., 24 hours). The range is 0 to 214783647.</p> <p><b>Note:</b> It is not recommend to set this parameter to beyond one month (i.e., 2592000 seconds).</p>                     |

| Parameter                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 57.2 Management Parameters

This subsection describes the device's Web and Telnet parameters.

### 57.2.1 General Parameters

The general management parameters are described in the table below.

**General Management Parameters**

| Parameter                                                                                                   | Description                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WAN OAMP Interface<br>CLI: bind GigabitEthernet<br><slot/port.vlanId> oamp<br><b>[OAMPWanInterfaceName]</b> | Binds the OAMP interface to a WAN interface, which can later be associated with a Virtual Routing and Forwarding (VRF).                                                                                                                                     |
| Web: Allow WAN access to HTTP<br>CLI: wan-http-allow<br><b>[AllowWanHTTP]</b>                               | Enables WAN access to the management interface through HTTP. <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>   |
| Web: Allow WAN access to HTTPS<br>CLI: wan-https-allow<br><b>[AllowWanHTTPS]</b>                            | Enables WAN access to the management interface through HTTPS. <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>  |
| Web: Allow WAN access to SNMP<br>CLI: wan-snmp-allow<br><b>[AllowWanSNMP]</b>                               | Enables WAN access to the management interface through SNMP. <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>   |
| <b>Web: Allow WAN access to Telnet</b><br>CLI: wan-telnet-allow<br><b>[AllowWanTelnet]</b>                  | Enables WAN access to the management interface through Telnet. <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p> |
| Web: Allow WAN access to SSH<br>CLI: wan-ssh-allow<br><b>[AllowWanSSH]</b>                                  | Enables WAN access to the management interface through SSH. <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>    |

| Parameter                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Web and Telnet Access List Table<br>EMS: Web Access Addresses<br><b>[WebAccessList_x]</b> | <p>This table configures up to ten IP addresses that are permitted to access the device's Web interface and Telnet interfaces. Access from an undefined IP address is denied. When no IP addresses are defined in this table, this security feature is inactive (i.e., the device can be accessed from any IP address).</p> <p>The default is 0.0.0.0 (i.e., the device can be accessed from any IP address).</p> <p>For example:<br/>WebAccessList_0 = 10.13.2.66<br/>WebAccessList_1 = 10.13.77.7</p> <p>For a description of this parameter, see 'Configuring Web and Telnet Access List' on page 67.</p> |

## 57.2.2 Web Parameters

The Web parameters are described in the table below.

**Web Parameters**

| Parameter                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Password Change Interval<br><b>[WebUserPassChangeInterval]</b> | <p>Defines the duration (in minutes) of the validity of Web login passwords. When this duration expires, the password of the Web user must be changed.</p> <p>The valid value is 0 to 100000, where 0 means that the password is always valid. The default is 1140.</p> <p><b>Note:</b> This parameter is applicable only when using the Web Users table, where the default value of the 'Password Age' parameter in the Web Users table inherits this parameter's value.</p>                                 |
| Web: User inactivity timer<br><b>[UserInactivityTimer]</b>          | <p>Defines the duration (in days) for which a user has not logged in to the Web interface, after which the status of the user becomes inactive and can no longer access the Web interface. These users can only log in to the Web interface if their status is changed (to New or Valid) by a System Administrator or Master user.</p> <p>The valid value is 0 to 10000, where 0 means inactive. The default is 90.</p> <p><b>Note:</b> This parameter is applicable only when using the Web Users table.</p> |
| Web: Session Timeout<br><b>[WebSessionTimeout]</b>                  | <p>Defines the duration (in minutes) of Web inactivity of a logged-in user, after which the user is automatically logged off the Web interface.</p> <p>The valid value is 0-100000, where 0 means no timeout. The default is 15.</p> <p><b>Note:</b> This parameter can apply to all users, or per user when set in the Web Users table.</p>                                                                                                                                                                  |
| Web: Deny Access On Fail Count<br><b>[DenyAccessOnFailCount]</b>    | <p>Defines the maximum number of failed login attempts, after which the requesting IP address is blocked.</p> <p>The valid value range is 0 to 10. The values 0 and 1 mean immediate block. The default is 3.</p>                                                                                                                                                                                                                                                                                             |

| Parameter                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Deny Authentication Timer<br>EMS: WEB Deny Authentication Timer<br><b>[DenyAuthenticationTimer]</b> | <p>Defines the duration (in seconds) for which login to the Web interface is denied from a specific IP address (for all users) when the number of failed login attempts has exceeded the maximum. This maximum is defined by the DenyAccessOnFailCount parameter. Only after this time expires can users attempt to login from this same IP address.</p> <p>The valid value is 0 to 100000, where 0 means that login is not denied regardless of number of failed login attempts. The default is 60.</p>                                                                                                                                                                                                                                                                                                                                                                         |
| Web: Display Login Information<br><b>[DisplayLoginInformation]</b>                                       | <p>Enables display of user's login information on each successful login attempt.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = Disable (default)</li> <li><b>[1]</b> = Enable</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>[EnableMgmtTwoFactorAuthentication]</b>                                                               | <p>Enables Web login authentication using a third-party, smart card.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = Disable (default)</li> <li><b>[1]</b> = Enable</li> </ul> <p>When enabled, the device retrieves the Web user's login username from the smart card, which is automatically displayed (read-only) in the Web Login screen; the user is then required to provide only the login password.</p> <p>Typically, a TLS connection is established between the smart card and the device's Web interface, and a RADIUS server is implemented to authenticate the password with the username. Thus, this feature implements a two-factor authentication - what the user has (the physical card) and what the user knows (i.e., the login password).</p>                                                                                                        |
| EMS: HTTPS Port<br>CLI: http-port<br><b>[HTTPport]</b>                                                   | <p>Defines the LAN HTTP port for Web management (default is 80). To enable Web management from the LAN, configure the desired port.</p> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| EMS: Disable WEB Config<br><b>[DisableWebConfig]</b>                                                     | <p>Determines whether the entire Web interface is read-only.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) Enables modifications of parameters.</li> <li><b>[1]</b> = Web interface is read-only.</li> </ul> <p>When in read-only mode, parameters can't be modified. In addition, the following pages can't be accessed: 'Web User Accounts', 'Certificates', 'Regional Settings', 'Maintenance Actions' and all file-loading pages ('Load Auxiliary Files', 'Software Upgrade Wizard', and 'Configuration File').</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>For this parameter to take effect, a device reset is required.</li> </ul>                                                                                                                                                                                                |
| <b>[ResetWebPassword]</b>                                                                                | <p>Resets the username and password of the primary ("Admin") and secondary ("User") accounts to their default settings ("Admin" and "Admin" respectively), and deletes all other users that may have been configured.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) Password and username retain their values.</li> <li><b>[1]</b> = Password and username are reset.</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>For this parameter to take effect, a device reset is required.</li> <li>You cannot reset the username and password through the Web interface (by loading an ini file or on the AdminPage). To reset the username and password, use SNMP: <ul style="list-style-type: none"> <li>a. Set acSysGenericINILine to WEBPasswordControlViaSNMP = 1, and reset the device with a flash burn (set</li> </ul> </li> </ul> |

| Parameter               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         | <p>acSysActionSetResetControl to 1 and acSysActionSetReset to 1).</p> <p><b>b.</b> Change the username and password in the acSysWEBAccessEntry table. Use the following format:<br/>           Username acSysWEBAccessUserName: old/pass/new<br/>           Password acSysWEBAccessUserCode: username/old/new</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>[WelcomeMessage]</b> | <p>Enables and defines a Welcome message that appears on the Web Login page for logging in to the Web interface.<br/>           The format of this parameter is as follows:</p> <p><b>[WelcomeMessage]</b><br/>           FORMAT WelcomeMessage_Index = WelcomeMessage_Text<br/> <b>[WelcomeMessage]</b></p> <p>For Example:<br/>           FORMAT WelcomeMessage_Index = WelcomeMessage_Text<br/>           WelcomeMessage 1 = "*****";<br/>           WelcomeMessage 2 = "***** This is a Welcome message *****";<br/>           WelcomeMessage 3 = "*****";</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>Each index row represents a line of text in the Welcome message box. Up to 20 lines (or rows) of text can be defined.</li> <li>The configured text message must be enclosed in double quotation marks (i.e., "...").</li> <li>If this parameter is not configured, no Welcome message is displayed.</li> </ul> |

### 57.2.3 Telnet Parameters

The Telnet parameters are described in the table below. Note: Telnet is currently supported only for debugging from the LAN interface.

**Telnet Parameters**

| Parameter                                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Embedded Telnet Server<br>EMS: Server Enable<br>CLI: telnet<br><b>[TelnetServerEnable]</b>  | <p>Enables the device's embedded Telnet server. Telnet is disabled by default for security.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable Unsecured</li> <li><b>[2]</b> Enable Secured (SSL)</li> </ul> <p><b>Note:</b> Only the primary Web User Account (which has Security Administration access level) can access the device using Telnet (see 'Configuring Web User Accounts' on page 58).</p> |
| Web: Telnet Server TCP Port<br>EMS: Server Port<br>CLI: telnet-port<br><b>[TelnetServerPort]</b> | <p>Defines the port number for the embedded Telnet server.<br/>           The valid range is all valid port numbers. The default port is 23.</p>                                                                                                                                                                                                                                                                                                         |
| Web: Telnet Server Idle Timeout<br>EMS: Server Idle                                              | <p>Defines the timeout (in minutes) for disconnection of an idle Telnet session. When set to zero, idle sessions are not disconnected.</p>                                                                                                                                                                                                                                                                                                               |

| Parameter                                                       | Description                                                                                                                    |
|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Disconnect<br>CLI: idle-timeout<br>[TelnetServerIdleDisconnect] | The valid range is any value. The default is 0.<br><b>Note:</b> For this parameter to take effect, a device reset is required. |

## 57.2.4 SNMP Parameters

The SNMP parameters are described in the table below.

**SNMP Parameters**

| Parameter                                         | Description                                                                                                                                                                                                                                                                               |
|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Enable SNMP<br>CLI: disable<br>[DisableSNMP] | Enables SNMP.<br><ul style="list-style-type: none"> <li>[0] Enable = (Default) SNMP is enabled.</li> <li>[1] Disable = SNMP is disabled and no traps are sent.</li> </ul>                                                                                                                 |
| CLI: port<br>[SNMPPort]                           | Defines the device's local (LAN) UDP port used for SNMP Get/Set commands.<br>The range is 100 to 3999. The default port is 161.<br><b>Note:</b> For this parameter to take effect, a device reset is required.                                                                            |
| [ChassisPhysicalAlias]                            | Defines the 'alias' name object for the physical entity as specified by a network manager, and provides a non-volatile 'handle' for the physical entity.<br>The valid range is a string of up to 255 characters.                                                                          |
| [ChassisPhysicalAssetID]                          | Defines the user-assigned asset tracking identifier object for the device's chassis as specified by an EMS, and provides non-volatile storage of this information.<br>The valid range is a string of up to 255 characters.                                                                |
| [ifAlias]                                         | Defines the textual name of the interface. The value is equal to the ifAlias SNMP MIB object.<br>The valid range is a string of up to 64 characters.                                                                                                                                      |
| EMS: Keep Alive Trap Port<br>[KeepAliveTrapPort]  | Defines the port to which keep-alive traps are sent.<br>The valid range is 0 - 65534. The default is port 162.                                                                                                                                                                            |
| [SendKeepAliveTrap]                               | Enables keep-alive traps and sends them every 9/10 of the time as defined by the NATBindingDefaultTimeout parameter.<br><ul style="list-style-type: none"> <li>[0] = Disable</li> <li>[1] = Enable</li> </ul> <b>Note:</b> For this parameter to take effect, a device reset is required. |
| CLI: sys-oid<br>[SNMPSysOid]                      | Defines the base product system OID.<br>The default is eSNMP_AC_PRODUCT_BASE_OID_D.<br><b>Note:</b> For this parameter to take effect, a device reset is required.                                                                                                                        |
| [SNMPTrapEnterpriseOid]                           | Defines the Trap Enterprise OID.<br>The default is eSNMP_AC_ENTERPRISE_OID.<br>The inner shift of the trap in the AcTrap subtree is added to the end of the OID in this parameter.<br><b>Note:</b> For this parameter to take effect, a device reset is required.                         |
| [acUserInputAlarmDescription]                     | Defines the description of the input alarm.                                                                                                                                                                                                                                               |

| Parameter                                                                                                                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Web: SNMP Trusted Managers<br>CLI: configure system > snmp > trusted-managers<br><b>[SNMPTrustedMgr_x]</b> | Defines up to five IP addresses of remote trusted SNMP managers from which the SNMP agent accepts and processes SNMP Get and Set requests.<br><b>Notes:</b> <ul style="list-style-type: none"> <li>By default, the SNMP agent accepts SNMP Get and Set requests from any IP address, as long as the correct community string is used in the request. Security can be enhanced by using Trusted Managers, which is an IP address from which the SNMP agent accepts and processes SNMP requests.</li> <li>If no values are assigned to these parameters any manager can access the device.</li> <li>Trusted managers can work with all community strings.</li> </ul> |
| <b>SNMP V3 Users Table</b>                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Web/EMS: SNMP V3 Users<br>CLI: configure system > snmp v3-users<br><b>[SNMPUsers]</b>                      | This <i>parameter</i> table defines SNMP v3 users. The format of this parameter is as follows:<br><b>[SNMPUsers]</b><br>FORMAT SNMPUsers_Index = SNMPUsers_Username, SNMPUsers_AuthProtocol, SNMPUsers_PrivProtocol, SNMPUsers_AuthKey, SNMPUsers_PrivKey, SNMPUsers_Group;<br><b>[SNMPUsers]</b><br>For example:<br>SNMPUsers 1 = v3admin1, 1, 0, myauthkey, -, 1;<br>The example above configures user 'v3admin1' with security level authNoPriv(2), authentication protocol MD5, authentication text password 'myauthkey', and ReadWriteGroup2.<br><b>Note:</b> For a description of this table, see 'Configuring SNMP V3 Users' on page 80.                    |

## 57.2.5 CLI Parameters

The command-line interface (CLI) parameters are described in the table below.

**CLI Parameters**

| Parameter                                                              | Description                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLI: aaa authentication login tacacs+<br><b>[TacPlusEnable]</b>        | Enables the Terminal Access Controller Access-Control System (TACACS+) remote authentication protocol and user authentication for CLI login. <ul style="list-style-type: none"> <li><b>[0]</b> = Disabled (default)</li> <li><b>[1]</b> = Enabled</li> </ul> <b>Note:</b> For this parameter to take effect, a device reset is required. |
| CLI: tacacs-server host <host-ip><br><b>[TacPlusServerIP]</b>          | Defines the IP address (in dotted-decimal notation) of the TACACS+ primary authentication server.                                                                                                                                                                                                                                        |
| CLI: tacacs-server host <host-ip><br><b>[TacPlusSecondaryServerIP]</b> | Defines the IP address (in dotted-decimal notation) of the TACACS+ secondary authentication server.                                                                                                                                                                                                                                      |
| CLI: tacacs-server port <port-num><br><b>[TacPlusPort]</b>             | Defines the TACACS+ authentication port (UDP) for authenticating with the RADIUS server.<br>The valid value range is 1 to 15. The default is 49.                                                                                                                                                                                         |
| CLI: tacacs-server timeout <seconds><br><b>[TacPlusTimeout]</b>        | Defines the TACACS+ response timeout (in seconds). If no response is received within this period, retransmission is required.<br>The valid value range is 1 to 15. The default is 5.                                                                                                                                                     |
| CLI: tacacs-server key <password><br><b>[TacPlusSharedSecret]</b>      | Defines the TACACS+ shared secret between client and server.<br>The valid value can be a string of up to 64 characters. The default is "msbg".                                                                                                                                                                                           |

## 57.2.6 TR-069 Parameters

The TR-069 parameters are described in the table below.

**TR-069 Parameters**

| Parameter                                                                   | Description                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: TR069<br>CLI: service<br><b>[TR069ServiceEnable]</b>                   | Enables TR-069 management. <ul style="list-style-type: none"> <li><b>[0]</b> Disable (Default)</li> <li><b>[1]</b> Enable</li> </ul> <b>Note:</b> For this parameter to take effect, a device reset is required. |
| Web: Connection Interface<br>CLI: interface-type<br><b>[TR069WanEnable]</b> | Defines the device's network interface for the TR-069 connection. <ul style="list-style-type: none"> <li><b>[0]</b> LAN</li> <li><b>[1]</b> WAN (default)</li> </ul>                                             |

| Parameter                                                                                      | Description                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Protocol<br>CLI: protocol<br><b>[TR069Protocol]</b>                                       | Defines the protocol used for the TR-069 connection. <ul style="list-style-type: none"> <li>▪ [0] HTTP (default)</li> <li>▪ [1] HTTPS</li> </ul>                                                                                                                                                                  |
| Web: Port<br>CLI: port<br><b>[TR069HTTPPort]</b>                                               | Defines the local HTTP/S port used for TR-069.<br>The valid range is 0 to 65535. The default is 82.<br><b>Note:</b> For this parameter to take effect, a device reset is required.                                                                                                                                |
| Web: URL<br>CLI: acl-url<br><b>[TR069AcsUrl]</b>                                               | Defines the URL address of the Auto Configuration Servers (ACS) to which the device connects. For example, http://10.4.2.1:10301/acs/.<br>By default, no URL is defined.                                                                                                                                          |
| Web: User Name<br>CLI: acs-user-name<br><b>[TR069AcsUsername]</b>                              | Defines the login username that the device uses for authenticated access to the ACS.<br>The valid value is a string of up to 256 characters. By default, no username is defined.                                                                                                                                  |
| Web: Password<br>CLI: acs-password<br><b>[TR069AcsPassword]</b>                                | Defines the login password that the device uses for authenticated access to the ACS.<br>The valid value is a string of up to 256 characters. By default, no password is defined.                                                                                                                                  |
| Web: URL<br>CLI: connection-request-url<br><b>[TR069ConnectionRequestUrl]</b>                  | Defines the URL for the ACS connection request. For example, http://10.31.4.115:82/tr069/.                                                                                                                                                                                                                        |
| Web: User Name<br>CLI: connection-request-user-name<br><b>[TR069ConnectionRequestUsername]</b> | Defines the connection request username used by the ACS to connect to the device.<br>The valid value is a string of up to 256 characters. By default, no username is defined.                                                                                                                                     |
| Web: Password<br>CLI: connection-request-password<br><b>[TR069ConnectionRequestPassword]</b>   | Defines the connection request password used by the ACS to connect to the device.<br>The valid value is a string of up to 256 characters. By default, no password is defined.                                                                                                                                     |
| Web: Inform Interval<br>CLI: inform-interval<br><b>[TR069PeriodicInformInterval]</b>           | Defines the inform interval (in seconds) at which the device periodically communicates with the ACS. Each time the device communicates with the ACS, the ACS sends a response indicating whether or not the ACS has an action to execute on the device.<br>The valid value is 0 to 4294967295. The default is 60. |
| <b>[TR069RetryinimumWaitInterval]</b>                                                          | Defines the minimum interval (in seconds) that the device waits before attempting again to communicate with the ACS after the previous communication attempt failure.<br>The valid value is 1 to 65535. The default is 5.                                                                                         |
| CLI: debug-mode<br><b>[TR069DebugMode]</b>                                                     | Defines the debug mode level, which is the type of messages sent to the Syslog server.<br>The valid value is between 0 and 3, where 0 (default) means no debug messages are sent and 3 is all message types are sent.                                                                                             |

## 57.2.7 Serial Parameters

The RS-232 serial parameters are described in the table below.

**Serial Parameters**

| Parameter                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [DisableRS232]                           | <p>Enables the device's RS-232 (serial) port.</p> <ul style="list-style-type: none"> <li>▪ [0] = Enabled</li> <li>▪ [1] = (Default) Disabled</li> </ul> <p>The RS-232 serial port can be used to change the networking parameters and view error/notification messages. For how to establish a serial communication with the device, refer to the <i>Installation Manual</i>.</p> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p> |
| EMS: Baud Rate<br>[SerialBaudRate]       | <p>Defines the RS-232 baud rate.</p> <p>The valid values include the following: 1200, 2400, 9600, 14400, 19200, 38400, 57600, or 115200 (default).</p> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                            |
| EMS: Data<br>[SerialData]                | <p>Defines the RS-232 data bit.</p> <ul style="list-style-type: none"> <li>▪ [7] = 7-bit</li> <li>▪ [8] = (Default) 8-bit</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                              |
| EMS: Parity<br>[SerialParity]            | <p>Defines the RS-232 polarity.</p> <ul style="list-style-type: none"> <li>▪ [0] = (Default) None</li> <li>▪ [1] = Odd</li> <li>▪ [2] = Even</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                           |
| EMS: Stop<br>[SerialStop]                | <p>Defines the RS-232 stop bit.</p> <ul style="list-style-type: none"> <li>▪ [1] = (Default) 1-bit (default)</li> <li>▪ [2] = 2-bit</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                    |
| EMS: Flow Control<br>[SerialFlowControl] | <p>Defines the RS-232 flow control.</p> <ul style="list-style-type: none"> <li>▪ [0] = (Default) None</li> <li>▪ [1] = Hardware</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                        |

## 57.3 Debugging and Diagnostics Parameters

This subsection describes the device's debugging and diagnostic parameters.

### 57.3.1 General Parameters

The general debugging and diagnostic parameters are described in the table below.

**General Debugging and Diagnostic Parameters**

| Parameter                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLI: enablesecsyslog<br><b>[EnableSecSyslog]</b>       | <p>Enables the reporting of security-related events for the data-router networking. When enabled, the data-router access list rules, configured using the access-list CLI command, which are set to "log", send Syslog messages whenever traffic matching the access list is encountered.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> = (Default) Disabled</li> <li>▪ <b>[1]</b> = Enabled</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| EMS: Enable Diagnostics<br><b>[EnableDiagnostics]</b>  | <p>Determines the method for verifying correct functioning of the different hardware components on the device. On completion of the check and if the test fails, the device sends information on the test results of each hardware component to the Syslog server.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> = (Default) Rapid and Enhanced self-test mode.</li> <li>▪ <b>[1]</b> = Detailed self-test mode (full test of DSPs, PCM, Switch, LAN, PHY and Flash).</li> <li>▪ <b>[2]</b> = A quicker version of the Detailed self-test mode (full test of DSPs, PCM, Switch, LAN, PHY, but partial test of Flash).</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                                      |
| Web: Enable LAN Watchdog<br><b>[EnableLanWatchDog]</b> | <p>Enables the LAN watchdog feature.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>When LAN watchdog is enabled, the device's overall communication integrity is checked periodically. If no communication is detected for about three minutes, the device performs a self test:</p> <ul style="list-style-type: none"> <li>▪ If the self-test succeeds, the problem is a logical link down (i.e., Ethernet cable disconnected on the switch side) and the Busy Out mechanism is activated if enabled (i.e., the parameter EnableBusyOut is set to 1).</li> <li>▪ If the self-test fails, the device restarts to overcome internal fatal communication error.</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ For this parameter to take effect, a device reset is required.</li> <li>▪ Enable LAN watchdog is relevant only if the Ethernet connection is full duplex.</li> </ul> |
| <b>[LifeLineType]</b>                                  | <p>Defines the condition(s) upon which the Lifeline analog (FXS) feature is activated. The Lifeline feature can be activated upon a power outage or network failure (i.e., loss of IP connectivity). Upon any of these conditions, the Lifeline feature provides PSTN connectivity and thus call continuity for the FXS phone users.</p> <p>If the device is in Lifeline mode and the scenario that caused it to enter Lifeline (e.g., power outage) no longer exists (e.g., power returns), the device exists Lifeline and operates as normal.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameter                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                             | <ul style="list-style-type: none"> <li>▪ <b>[0]</b> = (Default) Lifeline is activated upon power outage.</li> <li>▪ <b>[1]</b> = Lifeline is activated upon power outage.</li> <li>▪ <b>[2]</b> = Lifeline is activated upon a power outage, network failure (logical link disconnection), or when the Trunk Group is in Busy Out state (see the EnableBusyOut parameter).</li> </ul> <p>The Lifeline (FXS) phone is connected to FXS Port 1. FXS Port 1 connects to the POTS (Lifeline) phone as well as to the PSTN / PBX, using a splitter cable.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ For this parameter to take effect, a device reset is required.</li> <li>▪ This parameter is applicable only to FXS interfaces.</li> <li>▪ To enable Lifeline upon a network failure, the LAN watch dog must be activated (i.e., set the parameter EnableLANWatchDog to 1).</li> <li>▪ The number of supported Lifelines depends on the device's hardware configuration. For the combined FXS/FXO configuration, one Lifeline is available; for the 12-FXS configuration, up to three Lifelines are available.</li> <li>▪ For information on Lifeline cabling, refer to the Installation Manual.</li> </ul> |
| Web: Delay After Reset<br><b>[sec]</b><br>CLI: delay-after-reset<br><b>[GWAppDelayTime]</b> | <p>Defines the time interval (in seconds) that the device's operation is delayed after a reset.</p> <p>The valid range is 0 to 45. The default is 7 seconds.</p> <p><b>Note:</b> This feature helps overcome connection problems caused by some LAN routers or IP configuration parameters' modifications by a DHCP server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>[EnableAutoRAITransmitBER]</b>                                                           | <p>Enables the device to send a remote alarm indication (RAI) when the bit error rate (BER) is greater than 0.001.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Web: Ignore BRI LOS Alarm<br>CLI: ignore-bri-los-alarm<br><b>[IgnoreBRILOSAAlarm]</b>       | <p>Enables the device to ignore LOS alarms received from the BRI user-side trunk and attempts to make a call (relevant for IP-to-Tel calls).</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable</li> <li>▪ <b>[1]</b> Enable (default)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### 57.3.2 SIP Test Call Parameters

The SIP Signaling Test Call parameters are described in the table below.

**SIP Test Call Parameters**

| Parameter                                                                              | Description                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Test Call DTMF String<br>CLI: testcall-dtmf-string<br><b>[TestCallDtmfString]</b> | <p>Defines the DTMF tone that is played for answered test calls (incoming and outgoing).</p> <p>The DTMF string can be up to 15 strings. The default is "3212333". An empty string means that no DTMF is played.</p>                                             |
| Web: Test Call ID<br>CLI: testcall-id<br><b>[TestCallID]</b>                           | <p>Defines the test call prefix number (<i>ID</i>) of the simulated phone on the device. Incoming calls received with this called prefix number are identified as test calls.</p> <p>This can be any string of up to 15 characters. By default, no number is</p> |

| Parameter                                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                                                                                                                        | <p>defined.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>This parameter is only for testing incoming calls destined to this prefix number.</li> <li>This feature is applicable to all applications (GW/IP-to-IP and SBC).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <p>Web: SBC Test ID</p> <p>CLI: sbc-test-id</p> <p><b>[SBCtestID]</b></p>                                              | <p>Defines the SBC test call prefix (ID) for identifying SBC test calls that traverse the device to register with an external routing entity such as an IP PBX or proxy server.</p> <p>This parameter functions together with the TestCallID parameter, which defines the prefix of the simulated endpoint. Upon receiving an incoming call with this prefix, the device removes the prefix, enabling it to forward the test call to the external entity. Upon receiving the call from the external entity, the device identifies the call as a test call according to its prefix, defined by the TestCallID, and then sends the call to the simulated endpoint.</p> <p>For example, assume SBCtestID is set to 4 and TestCallID to 2. If a call is received with called destination 4200, the device removes the prefix 4 and routes the call to the IP PBX. When it receives the call from the IP PBX, it identifies the call as a test call (i.e., prefix 2) and therefore, sends it to the simulated endpoint.</p> <p>The valid value can be any string of up to 15 characters. By default, no number is defined.</p> <p><b>Note:</b> This feature is applicable only to the SBC application.</p> |
| <b>Test Call Table</b>                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Web: Media CDR Report Level<br><b>[MediaCDRReportLevel]</b>                   | <p>Enables media-related CDRs of SBC calls to be sent to a Syslog server and determines the call stage at which they are sent.</p> <ul style="list-style-type: none"> <li><b>[0]</b> None = (Default) No media-related CDR is sent.</li> <li><b>[1]</b> End Media = Sends a CDR only at the end of the call.</li> <li><b>[2]</b> Start &amp; End Media = Sends a CDR once the media starts. In some calls it may only be after the call is established, but in other calls the media may start at ringback tone. A CDR is also sent upon termination (end) of the media in the call.</li> <li><b>[3]</b> Update &amp; End Media = Sends a CDR when an update occurs in the media of the call. For example, a call starts and a ringback tone occurs, a re-INVITE is sent for a fax call and as a result, a CDR with the MediaReportType field set to "Update" is sent, as the media was changed from voice to T.38. A CDR is also sent upon termination (end) of the media in the call.</li> <li><b>[4]</b> Start &amp; End &amp; Update Media = Sends a CDR at the start of the media, upon an update in the media (if occurs), and at the end of the media.</li> </ul> <p><b>Note:</b> To enable CDR generation as well as enable signaling-related CDRs, use the CDRReportLevel parameter.</p>                                                                                                                                                                                                                                            |
| Web/EMS: Debug Level<br>CLI: debug-level<br><b>[GwDebugLevel]</b>             | <p>Defines the Syslog debug logging level.</p> <ul style="list-style-type: none"> <li><b>[0]</b> 0 = (Default) Debug is disabled.</li> <li><b>[1]</b> 1 = Flow debugging is enabled.</li> <li><b>[5]</b> 5 = Flow, device interface, stack interface, session manager, and device interface expanded debugging are enabled.</li> <li><b>[7]</b> 7 = This option is recommended when the device is running under "heavy" traffic. In this mode: <ul style="list-style-type: none"> <li>✓ The Syslog debug level automatically changes between level 5, level 1, and level 0, depending on the device's CPU consumption so that VoIP traffic isn't affected.</li> <li>✓ Syslog messages are bundled into a single UDP packet, after which they are sent to a Syslog server (bundling size is determined by the MaxBundleSyslogLength parameter). Bundling reduces the number of UDP Syslog packets, thereby improving CPU utilization.</li> </ul> </li> </ul> <p>Note that when this option is used, in order to read Syslog messages with Wireshark, a special plug-in (i.e., acsyslog.dll) must be used. Once the plug-in is installed, the Syslog messages are decoded as "AC SYSLOG" and are displayed using the 'acsyslog' filter instead of the regular 'syslog' filter.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>This parameter is typically set to 5 if debug traces are required. However, in cases of heavy traffic, option 7 is recommended.</li> <li>Options 2, 3, 4, and 6 are not recommended.</li> </ul> |
| Web: Syslog Facility Number<br>EMS: SyslogFacility<br><b>[SyslogFacility]</b> | <p>Defines the Facility level (0 through 7) of the device's Syslog messages, according to RFC 3164. This allows you to identify Syslog messages generated by the device. This is useful, for example, if you collect the device's and other equipments' Syslog messages, at one single server. The device's Syslog messages can easily be identified and distinguished from other Syslog messages by its Facility level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 57.3.4 Resource Allocation Indication Parameters

The Resource Allocation Indication (RAI) parameters are described in the table below.

**RAI Parameters**

| Parameter          | Description                                                                                                                                                                                                                                                                             |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>[EnableRAI]</b> | <p>Enables RAI alarm generation if the device's busy endpoints exceed a user-defined threshold.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) Disable RAI (Resource Available Indication) service.</li> <li><b>[1]</b> = RAI service enabled and an SNMP</li> </ul> |

| Parameter          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | 'acBoardCallResourcesAlarm' Alarm Trap is sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| [RAIHighThreshold] | <p>Defines the high threshold percentage of total calls that are active (busy endpoints). When the percentage of the device's busy endpoints exceeds this high threshold, the device sends the SNMP acBoardCallResourcesAlarm alarm trap with a 'major' alarm status.</p> <p>The range is 0 to 100. The default is 90.</p> <p><b>Note:</b> The percentage of busy endpoints is calculated by dividing the number of busy endpoints by the total number of "enabled" endpoints (trunks are physically connected and synchronized with no alarms and endpoints are defined in the Trunk Group Table).</p> |
| [RAILowThreshold]  | <p>Defines the low threshold percentage of total calls that are active (busy endpoints).</p> <p>When the percentage of the device's busy endpoints falls below this low threshold, the device sends an SNMP acBoardCallResourcesAlarm alarm trap with a 'cleared' alarm status.</p> <p>The range is 0 to 100%. The default is 90%.</p>                                                                                                                                                                                                                                                                  |
| [RAILoopTime]      | <p>Defines the time interval (in seconds) that the device periodically checks call resource availability.</p> <p>The valid range is 1 to 200. The default is 10.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 57.4 Security Parameters

This subsection describes the device's security parameters.

### 57.4.1 General Parameters

The general security parameters are described in the table below.

**General Security Parameters**

| Parameter                                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Firewall Table</b>                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Web/EMS: Internal Firewall Parameters<br>CLI: configure voip > access-list<br><b>[AccessList]</b> | <p>This table parameter defines the device's access list (firewall), which defines network traffic filtering rules.</p> <p>The format of this parameter is as follows:<br/> <b>[AccessList]</b><br/>           FORMAT AccessList_Index = AccessList_Source_IP, AccessList_Source_Port, AccessList_PrefixLen, AccessList_Source_Port, AccessList_Start_Port, AccessList_End_Port, AccessList_Protocol, AccessList_Use_Specific_Interface, AccessList_Interface_ID, AccessList_Packet_Size, AccessList_Byte_Rate, AccessList_Byte_Burst, AccessList_Allow_Type;<br/> <b>[AccessList]</b></p> <p>For example:<br/>           AccessList 10 = mgmt.customer.com, , , 32, 0, 80, tcp, 1, OAMP, 0, 0, 0, allow;<br/>           AccessList 22 = 10.4.0.0, , , 16, 4000, 9000, any, 0, , 0, 0, 0, block;</p> <p>In the example above, Rule #10 allows traffic from the host 'mgmt.customer.com' destined to TCP ports 0 to 80 on interface OAMP</p> |

| Parameter | Description                                                                                                                                                                                                               |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>(OAMP). Rule #22 blocks traffic from the subnet 10.4.xxx.yyy destined to ports 4000 to 9000.</p> <p><b>Note:</b> For a description of this table, see 'Configuring Firewall Settings' on page <a href="#">131</a>.</p> |

## 57.4.2 HTTPS Parameters

The Secure Hypertext Transport Protocol (HTTPS) parameters are described in the table below.

**HTTPS Parameters**

| Parameter                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Secured Web Connection (HTTPS)<br>EMS: HTTPS Only<br>CLI: secured-connection<br><b>[HTTPSOnly]</b>                  | Determines the protocol used to access the Web interface. <ul style="list-style-type: none"> <li><b>[0]</b> HTTP and HTTPS (default).</li> <li><b>[1]</b> HTTPS Only = Unencrypted HTTP packets are blocked.</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| EMS: HTTPS Port<br>CLI: https-port<br><b>[HTTPSPort]</b>                                                                 | Defines the local Secured HTTPS port of the device. This parameter allows secure remote device Web management from the LAN. To enable secure Web management from the LAN, configure the desired port. The valid range is 1 to 65535 (other restrictions may apply within this range). The default port is 443.<br><p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Web/EMS: HTTPS Cipher String<br>CLI: https-cipher-string<br><b>[HTTSPCipherString]</b>                                   | Defines the Cipher string for HTTPS (in OpenSSL cipher list format). For the valid range values, refer to URL <a href="http://www.openssl.org/docs/apps/ciphers.html">http://www.openssl.org/docs/apps/ciphers.html</a> .<br>The default is 'RC4:EXP' (Export encryption algorithms). For example, use 'ALL' for all ciphers suites (e.g., for ARIA encryption for TLS). The only ciphers available are RC4 and DES, and the cipher bit strength is limited to 56 bits.<br><p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>For this parameter to take effect, a device reset is required.</li> <li>If the "Strong Encryption" Software License Key is enabled, the default of this parameter is changed to 'RC4:EXP', enabling RC-128bit encryption.</li> <li>The value 'ALL' can be configured only if the "Strong Encryption" Software License Key is enabled.</li> </ul> |
| Web: HTTP Authentication Mode<br>EMS: Web Authentication Mode<br>CLI: http-auth-mode<br><b>[WebAuthMode]</b>             | Determines the authentication mode used for the Web interface. <ul style="list-style-type: none"> <li><b>[0]</b> Basic Mode = (Default) Basic authentication (clear text) is used.</li> <li><b>[1]</b> Web Based Authentication = Digest authentication (MD5) is used.</li> </ul> <p><b>Note:</b> If you enable RADIUS login (i.e., the WebRADIUSLogin parameter is set to 1), you must set the WebAuthMode parameter to Basic Mode [0].</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Web: Requires Client Certificates for HTTPS connection<br>CLI: req-client-cert<br><b>[HTTPSRequireClientCertificate]</b> | Determines whether client certificates are required for HTTPS connection. <ul style="list-style-type: none"> <li><b>[0]</b> Disable = (Default) Client certificates are not required.</li> <li><b>[1]</b> Enable = Client certificates are required. The client certificate must be preloaded to the device and its matching private key must be installed on the managing PC. Time and date must be correctly set on</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter | Description                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>the device for the client certificate to be verified.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>For this parameter to take effect, a device reset is required.</li> <li>For a description on implementing client certificates, see 'Client Certificates' on page 98.</li> </ul> |

### 57.4.3 SRTP Parameters

The Secure Real-Time Transport Protocol (SRTP) parameters are described in the table below.

**SRTP Parameters**

| Parameter                                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| (MKI) Size<br>EMS: Packet MKI Size<br>CLI: SRTP-tx-packet-MKI-size<br><b>[SRTPTxPacketMKISize]</b>              | SRTP Tx packets.<br>The range is 0 to 4. The default is 0 (i.e., new keys are generated without MKI).<br><b>Notes:</b> <ul style="list-style-type: none"> <li>For the GW/IP-to-IP application, the device only initiates the MKI size.</li> <li>You can also configure MKI size in an IP Profile.</li> <li>For the SBC application, the device can forward MKI size as is for SRTP-to-SRTP flows or override the MKI size during negotiation, using IP Profiles. This can be done on the inbound or outbound leg.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Web:Symmetric MKI Negotiation<br>EMS: Enable Symmetric MKI<br>CLI: symmetric-mki<br><b>[EnableSymmetricMKI]</b> | Enables symmetric MKI negotiation. <ul style="list-style-type: none"> <li><b>[0]</b> Disable = (Default) The device includes the MKI in its 200 OK response according to the SRTPTxPacketMKISize parameter (if set to 0, then it is not included; if set to any other value, it is included with this value).</li> <li><b>[1]</b> Enable = The answer crypto line contains (or excludes) an MKI value according to the selected crypto line in the offer. For example, assume that the device receives an INVITE containing the following two crypto lines in SDP: <pre>a=crypto:2 AES_CM_128_HMAC_SHA1_80 inline:TAaxNnQt8/qLQMnDuG4vxYfWl6K7eBK/ufk04pR4 2^31 1:1 a=crypto:3 AES_CM_128_HMAC_SHA1_80 inline:bnuYZnMxSfUiGitviWJZmzr70F3AiR00l5Vnh0kH 2^31</pre> The first crypto line includes the MKI parameter "1:1". In the 200 OK response, the device selects one of the crypto lines (i.e., '2' or '3'). Typically, it selects the first line that supports the crypto suite. However, for SRTP-to-SRTP in SBC sessions, it can be determined by the remote side on the outgoing leg. If the device selects crypto line '2', it includes the MKI parameter in its answer SDP, for example: <pre>a=crypto:2 AES_CM_128_HMAC_SHA1_80 inline:R1VyA1xV/qwBjkEklu4kSJyl3wCtYeZLq1/QFuxw 2^31 1:1</pre> If the device selects a crypto line that does not contain the MKI parameter, then the MKI parameter is not included in the crypto line in the SDP answer (even if the SRTPTxPacketMKISize parameter is set to any value other than 0). </li> </ul> <b>Notes:</b> <ul style="list-style-type: none"> <li>To enable symmetric MKI, the SRTPTxPacketMKISize parameter must be set to any value other than 0.</li> <li>You can also enable MKI negotiation per IP Profile.</li> </ul> |
| Web/EMS: SRTP offered Suites<br>CLI: offer-srtp-cipher<br><b>[SRTPofferedSuites]</b>                            | Defines the offered crypto suites (cipher encryption algorithms) for SRTP. <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) All available crypto suites.</li> <li><b>[1]</b> CIPHER SUITES AES CM 128 HMAC SHA1 80 = device uses AES-CM encryption with a 128-bit key and HMAC-SHA1 message authentication with a 80-bit tag.</li> <li><b>[2]</b> CIPHER SUITES AES CM 128 HMAC SHA1 32 = device</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|           | <p>session expire. This feature ensures that the roll-over counter (ROC), one of the parameters used in the SRTP encryption/decryption process of the SRTP packets, is synchronized on both sides for transmit and receive packets.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> = (Default) Disabled. ROC is not reset on the device side.</li> <li>▪ <b>[1]</b> = Enabled. If the session expires causing a session refresh through a re-INVITE, the device or server generates a new key and the device resets the ROC index (and other SRTP fields) as done by the server, resulting in a synchronized SRTP.</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ This feature can also be configured for an IP Profile.</li> <li>▪ If this feature is disabled and the server resets the ROC upon a re-key generation, one-way voice may occur.</li> </ul> |

## 57.4.4 TLS Parameters

The Transport Layer Security (TLS) parameters are described in the table below.

**TLS Parameters**

| Parameter                                                                                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web/EMS: TLS Version<br>CLI: version<br><b>[TLSVersion]</b>                                                                          | <p>Determines the supported versions of SSL/TLS (Secure Socket Layer/Transport Layer Security).</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> SSL 2.0-3.0 and TLS 1.0 = (Default) SSL 2.0, SSL 3.0, and TLS 1.0 are supported.</li> <li>▪ <b>[1]</b> TLS 1.0 Only = only TLS 1.0 is used.</li> </ul> <p>When set to 0, SSL/TLS handshakes always start with SSL 2.0 and switch to TLS 1.0 if both peers support it. When set to 1, TLS 1.0 is the only version supported; clients attempting to contact the device using SSL 2.0 are rejected.</p> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p> |
| Web: TLS Client Re-Handshake Interval<br>EMS: TLS Re Handshake Interval<br>CLI: tls-re-hndshk-int<br><b>[TLSReHandshakeInterval]</b> | <p>Defines the time interval (in minutes) between TLS Re-Handshakes initiated by the device.</p> <p>The interval range is 0 to 1,500 minutes. The default is 0 (i.e., no TLS Re-Handshake).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Web: TLS Mutual Authentication<br>EMS: SIPS Require Client Certificate<br><b>[SIPSRequireClientCertificate]</b>                      | <p>Determines the device's behavior when acting as a server for TLS connections.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable = (Default) The device does not request the client certificate.</li> <li>▪ <b>[1]</b> Enable = The device requires receipt and verification of the client certificate to establish the TLS connection.</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ For this parameter to take effect, a device reset is required.</li> <li>▪ The SIPS certificate files can be changed using the parameters HTTPSCertFileName and HTTPSRootFileName.</li> </ul>                   |
| Web/EMS: Peer Host Name Verification Mode                                                                                            | <p>Determines whether the device verifies the Subject Name of a remote certificate when establishing TLS connections.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter                                                                                                                                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>[PeerHostNameVerificationMode]</b>                                                                                                      | <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default).</li> <li>▪ <b>[1]</b> Server Only = Verify Subject Name only when acting as a client for the TLS connection.</li> <li>▪ <b>[2]</b> Server &amp; Client = Verify Subject Name when acting as a server or client for the TLS connection.</li> </ul> <p>When a remote certificate is received and this parameter is not disabled, the value of SubjectAltName is compared with the list of available Proxies. If a match is found for any of the configured Proxies, the TLS connection is established.</p> <p>The comparison is performed if the SubjectAltName is either a DNS name (DNSName) or an IP address. If no match is found and the SubjectAltName is marked as 'critical', the TLS connection is not established. If DNSName is used, the certificate can also use wildcards (*) to replace parts of the domain name.</p> <p>If the SubjectAltName is not marked as 'critical' and there is no match, the CN value of the SubjectName field is compared with the parameter TLSRemoteSubjectName. If a match is found, the connection is established. Otherwise, the connection is terminated.</p> <p><b>Note:</b> If you set this parameter to <b>[2]</b> (Server &amp; Client), for this functionality to operate, you also need to set the SIPSPRequireClientCertificate parameter to <b>[1]</b> (Enable).</p> |
| Web: TLS Client Verify Server Certificate<br>EMS: Verify Server Certificate<br>CLI: tls-vrfy-srvr-cert<br><b>[VerifyServerCertificate]</b> | <p>Determines whether the device, when acting as a client for TLS connections, verifies the Server certificate. The certificate is verified with the Root CA information.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p><b>Note:</b> If Subject Name verification is necessary, the parameter PeerHostNameVerificationMode must be used as well.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Web: Strict Certificate Extension Validation<br>CLI: require-strict-cert<br><b>[RequireStrictCert]</b>                                     | <p>Enables the validation of the extensions (keyUsage and extendedKeyUsage) of peer certificates. This validation ensures that the signing CA is authorized to sign certificates and that the end-entity certificate is authorized to negotiate a secure TLS connection.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Web/EMS: TLS Remote Subject Name<br>CLI: tls-rmt-subs-name<br><b>[TLSRemoteSubjectName]</b>                                                | <p>Defines the Subject Name that is compared with the name defined in the remote side certificate when establishing TLS connections.</p> <p>If the SubjectAltName of the received certificate is not equal to any of the defined Proxies Host names/IP addresses and is not marked as 'critical', the Common Name (CN) of the Subject field is compared with this value. If not equal, the TLS connection is not established. If the CN uses a domain name, the certificate can also use wildcards (*) to replace parts of the domain name.</p> <p>The valid range is a string of up to 49 characters.</p> <p><b>Note:</b> This parameter is applicable only if the parameter PeerHostNameVerificationMode is set to 1 or 2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Client Cipher String<br>CLI: client-cipher-string<br><b>[TLSClientCipherString]</b> | Defines the cipher-suite string for TLS clients.<br>The valid value is up to 255 strings. The default is "ALL:!ADH".<br>For example: TLSClientCipherString = 'EXP'<br>This parameter complements the HTTPSCipherString parameter (which affects TLS servers). For possible values and additional details, refer to: <a href="http://www.openssl.org/docs/apps/ciphers.html">http://www.openssl.org/docs/apps/ciphers.html</a> |
| CLI: pkey-size<br><b>[TLSPkeySize]</b>                                                   | Defines the key size (in bits) for RSA public-key encryption for newly self-signed generated keys for SSH. <ul style="list-style-type: none"> <li>▪ <b>[512]</b></li> <li>▪ <b>[768]</b></li> <li>▪ <b>[1024]</b> (default)</li> <li>▪ <b>[2048]</b></li> </ul>                                                                                                                                                               |

## 57.4.5 SSH Parameters

Secure Shell (SSH) parameters are described in the table below.

### SSH Parameters

| Parameter                                                                                                                  | Description                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web/EMS: Enable SSH Server<br>CLI: ssh<br><b>[SSHServerEnable]</b>                                                         | Enables the device's embedded SSH server. <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul>                                                                                                                                                                     |
| Web/EMS: Server Port<br>cli: ssh-port<br><b>[SSHServerPort]</b>                                                            | Defines the port number for the embedded SSH server.<br>Range is any valid port number. The default port is 22.                                                                                                                                                                                                             |
| Web/EMS: SSH Admin Key<br>CLI: ssh-admin-key<br><b>[SSHAdminKey]</b>                                                       | Defines the RSA public key for strong authentication for logging in to the SSH interface (if enabled).<br>The value should be a base64-encoded string. The value can be a maximum length of 511 characters.                                                                                                                 |
| Web: Require Public Key<br>EMS: EMS: SSH Require Public Key<br>CLI: ssh-require-public-key<br><b>[SSHRequirePublicKey]</b> | Enables RSA public keys for SSH. <ul style="list-style-type: none"> <li>▪ <b>[0]</b> = (Default) RSA public keys are optional if a value is configured for the parameter SSHAdminKey.</li> <li>▪ <b>[1]</b> = RSA public keys are mandatory.</li> </ul> <b>Note:</b> To define the key size, use the TLSPkeySize parameter. |
| Web: Max Payload Size<br>EMS: SSH Max Payload Size<br>CLI: ssh-max-payload-size<br><b>[SSHMaxPayloadSize]</b>              | Defines the maximum uncompressed payload size (in bytes) for SSH packets.<br>The valid value is 550 to 32768. The default is 32768.                                                                                                                                                                                         |
| Web: Max Binary Packet Size<br>EMS: SSH Max Binary Packet Size<br>CLI: ssh-max-binary-                                     | Defines the maximum packet size (in bytes) for SSH packets.<br>The valid value is 582 to 35000. The default is 35000.                                                                                                                                                                                                       |

| Parameter                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| packet-size<br>[SSHMaxBinaryPacket Size]                                                      |                                                                                                                                                                                                                                                                                                                                                                            |
| EMS: Telnet SSH Max Sessions<br>CLI: ssh-max-sessions<br>[SSHMaxSessions]                     | Defines the maximum number of simultaneous SSH sessions. The valid range is 1 to 2. The default is 2 sessions.                                                                                                                                                                                                                                                             |
| Web: Enable Last Login Message<br>CLI: ssh-last-login-message<br>[SSHEnableLastLogin Message] | Enables message display in SSH sessions of the time and date of the last SSH login. The SSH login message displays the number of unsuccessful login attempts since the last successful login. <ul style="list-style-type: none"> <li>[0] Disable</li> <li>[1] Enable (default)</li> </ul> <b>Note:</b> The last SSH login information is cleared when the device is reset. |
| Web: Max Login Attempts<br>CLI: ssh-max-login-attempts<br>[SSHMaxLoginAttempts]               | Defines the maximum SSH login attempts allowed for entering an incorrect password by an administrator before the SSH session is rejected. The valid range is 1 to 3. the default is 3.                                                                                                                                                                                     |

### 57.4.6 OCSP Parameters

The Online Certificate Status Protocol (OCSP) parameters are described in the table below.

**OCSP Parameters**

| Parameter                                                                         | Description                                                                                                                                                                  |
|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Enable OCSP Server<br>EMS: OCSP Enable<br>CLI: enable<br>[OCSPEnable]        | Enables or disables certificate checking using OCSP. <ul style="list-style-type: none"> <li>[0] Disable (default)</li> <li>[1] Enable</li> </ul>                             |
| Web: Primary Server IP<br>EMS: OCSP Server IP<br>CLI: server-ip<br>[OCSPServerIP] | Defines the IP address of the OCSP server. The default IP address is 0.0.0.0.                                                                                                |
| Web: Secondary Server IP<br>CLI: secondary-server-ip<br>[OCSPSecondaryServerIP]   | Defines the IP address (in dotted-decimal notation) of the secondary OCSP server (optional). The default IP address is 0.0.0.0.                                              |
| Web: Server Port<br>EMS: OCSP Server Port<br>CLI: server-port<br>[OCSPServerPort] | Defines the OCSP server's TCP port number. The default port number is 2560.                                                                                                  |
| Web: Default Response When Server Unreachable                                     | Determines the default OCSP behavior when the server cannot be contacted. <ul style="list-style-type: none"> <li>[0] Reject = (Default) Rejects peer certificate.</li> </ul> |

| Parameter                                                                           | Description                                                                                   |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| EMS: OCSP Default Response<br>CLI: default-response<br><b>[OCSPDefaultResponse]</b> | <ul style="list-style-type: none"> <li><b>[1]</b> Allow = Allows peer certificate.</li> </ul> |

## 57.4.7 IDS Parameters

The Intrusion Detection System (IDS) parameters are described in the table below.

**Table 57-1: IDS Parameters**

| Parameter                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Intrusion Detection System (IDS)<br>CLI: enable-ids<br><b>[EnableIDS]</b> | <p>Enables the IDS feature.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                                                      |
| CLI: ids-clear-period<br><b>[IDSArmClearPeriod]</b>                            | <p>Defines the interval (in seconds) after which an IDS alarm is cleared from the Active Alarms table if no thresholds are crossed during this time. However, this "quiet" period must be at least twice the Threshold Window value. For example, if IDSArmClearPeriod is set to 20 sec and the Threshold Window is set to 15 sec, the IDSArmClearPeriod parameter is ignored and the alarm is cleared only after 30 seconds (2 x 15 sec). The valid value is 0 to 86400. The default is 300.</p> |
| <b>IDS Policy Table</b>                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Web: Set Out-Of-Service On Registration Failure<br>EMS: Set OOS On Registration Fail<br>CLI: set-oos-on-reg-failure<br><b>[OOSOnRegistrationFail]</b> | <p>Enables setting the endpoint, trunk, or entire device (i.e., all endpoints) to out-of-service if registration fails.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>If the registration is per endpoint (i.e., AuthenticationMode is set to 0) or per Account (see Configuring Hunt Group Settings on page 291) and a specific endpoint/Account registration fails (SIP 4xx or no response), then that endpoint is set to out-of-service until a success response is received in a subsequent registration request. When the registration is per the entire device (i.e., AuthenticationMode is set to 1) and registration fails, all endpoints are set to out-of-service. If all the Accounts of a specific Trunk Group fail registration and if the Trunk Group comprises a complete trunk, then the entire trunk is set to out-of-service.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ This parameter is applicable only to the Gateway / IP-to-IP application.</li> <li>▪ The out-of-service method is configured using the FXSOOSBehavior parameter.</li> </ul>                                                                                            |
| CLI: expl-un-reg<br><b>[UnregistrationMode]</b>                                                                                                       | <p>Enables the device to perform explicit unregisters.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable = The device sends an asterisk ("*") value in the SIP Contact header, instructing the Registrar server to remove all previous registration bindings. The device removes SIP User Agent (UA) registration bindings in a Registrar, according to RFC 3261. Registrations are soft state and expire unless refreshed, but they can also be explicitly removed. A client can attempt to influence the expiration interval selected by the Registrar. A UA requests the immediate removal of a binding by specifying an expiration interval of "0" for that contact address in a REGISTER request. UA's should support this mechanism so that bindings can be removed before their expiration interval has passed. Use of the "*" Contact header field value allows a registering UA to remove all bindings associated with an address-of-record (AOR) without knowing their precise values.</li> </ul> <p><b>Note:</b> The REGISTER-specific Contact header field value of "*" applies to all registrations, but it can only be used if the Expires header field is present with a value of "0".</p> |
| Web/EMS: Add Empty Authorization Header<br>CLI: add-empty-author-hdr<br><b>[EmptyAuthorizationHeader]</b>                                             | <p>Enables the inclusion of the SIP Authorization header in initial registration (REGISTER) requests sent by the device.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>The Authorization header carries the credentials of a user agent (UA) in a request to a server. The sent REGISTER message populates the Authorization header with the following parameters:</p> <ul style="list-style-type: none"> <li>▪ username - set to the value of the private user identity</li> <li>▪ realm - set to the domain name of the home network</li> <li>▪ uri - set to the SIP URI of the domain name of the home network</li> <li>▪ nonce - set to an empty value</li> <li>▪ response - set to an empty value</li> </ul> <p>For example:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <p>EMS: Ping Pong Keep Alive<br/>[UsePingPongKeepAlive]</p>                             | <p>Enables the use of the carriage-return and line-feed sequences (CRLF) Keep-Alive mechanism, according to RFC 5626 "Managing Client-Initiated Connections in the Session Initiation Protocol (SIP)" for reliable, connection-orientated transport types such as TCP.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>The SIP user agent/client (i.e., device) uses a simple periodic message as a keep-alive mechanism to keep their flow to the proxy or registrar alive (used for example, to keep NAT bindings open). For connection-oriented transports such as TCP/TLS this is based on CRLF. This mechanism uses a client-to-server "ping" keep-alive and a corresponding server-to-client "pong" message. This ping-pong sequence allows the client, and optionally the server, to tell if its flow is still active and useful for SIP traffic. If the client does not receive a pong in response to its ping, it declares the flow "dead" and opens a new flow in its place. In the CRLF Keep-Alive mechanism the client periodically (defined by the PingPongKeepAliveTime parameter) sends a double-CRLF (the "ping") then waits to receive a single CRLF (the "pong"). If the client does not receive a "pong" within an appropriate amount of time, it considers the flow failed.</p> <p><b>Note:</b> The device sends a CRLF message to the Proxy Set only if the Proxy Keep-Alive feature (EnableProxyKeepAlive parameter) is enabled and its transport type is set to TCP or TLS. The device first sends a SIP OPTION message to establish the TCP/TLS connection and if it receives any SIP response, it continues sending the CRLF keep-alive sequences.</p> |
| <p>EMS: Ping Pong Keep Alive Time<br/>[PingPongKeepAliveTime]</p>                       | <p>Defines the periodic interval (in seconds) after which a "ping" (double-CRLF) keep-alive is sent to a proxy/registrar, using the CRLF Keep-Alive mechanism.</p> <p>The default range is 5 to 2,000,000. The default is 120.</p> <p>The device uses the range of 80-100% of this user-defined value as the actual interval. For example, if the parameter value is set to 200 sec, the interval used is any random time between 160 to 200 seconds. This prevents an "avalanche" of keep-alive by multiple SIP UAs to a specific server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 57.7.2 Network Application Parameters

The SIP network application parameters are described in the table below.

**SIP Network Application Parameters**

| Parameter                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>NAT Translation Table</b>                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Web: NAT Translation Table<br>CLI: configure voip > control-network NATTranslation<br>[NATTranslation] | This table parameter defines NAT rules for translating source IP addresses per VoIP interface (SIP control and RTP media traffic) into NAT IP addresses. This allows, for example, the separation of VoIP traffic between different ISTP's, and topology hiding (of internal IP addresses to the "public" network). Each IP interface (configured in the Multiple Interface table - InterfaceTable parameter) can be associated with a NAT rule in this table, translating the source IP address and port of the outgoing packet into the NAT address (IP address and port range).<br><br>The format of this parameter is as follows:<br><b>[ NATTranslation ]</b><br>FORMAT NATTranslation_Index =<br>NATTranslation_SourceIPInterfaceName,<br>NATTranslation_TargetIPAddress, NATTranslation_SourceStartPort,<br>NATTranslation_SourceEndPort, NATTranslation_TargetStartPort,<br>NATTranslation_TargetEndPort;<br><b>[ NATTranslation ]</b><br><b>Note:</b> For a detailed description of this table, see 'Configuring NAT Translation per IP Interface' on page 127. |

## 57.8 General SIP Parameters

The general SIP parameters are described in the table below.

**General SIP Parameters**

| Parameter                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: SIP Remote Reset<br>CLI: sip-remote-reset<br>[EnableSIPRemoteReset] | Enables a specific device action upon the receipt of a SIP NOTIFY request, where the action depends on the value received in the Event header.<br><ul style="list-style-type: none"> <li>[0] Disable (default)</li> <li>[1] Enable</li> </ul> The action depends on the Event header value: <ul style="list-style-type: none"> <li>'check-sync;reboot=false': triggers the regular Automatic Update feature (if Automatic Update has been enabled on the device)</li> <li>'check-sync;reboot=true': triggers a device reset</li> </ul> <b>Note:</b> The Event header value is proprietary to AudioCodes. |
| Web/EMS: Max SIP Message Length [KB]<br>[MaxSIPMessageLength]            | Defines the maximum size (in Kbytes) for each SIP message that can be sent over the network. The device rejects messages exceeding this user-defined size.<br>The valid value range is 1 to 50. The default is 50.                                                                                                                                                                                                                                                                                                                                                                                       |
| [SIPForceRport]                                                          | Determines whether the device sends SIP responses to the UDP port from where SIP requests are received even if the 'rport' parameter is not present in the SIP Via header.                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

This SIP parameter specifies the Trunk Group to which the call belongs (according to RFC 4904). For example, the SIP message below indicates that the call belongs to Trunk Group ID 1:</p> <pre>INVITE sip::+16305550100;tgrp=1;trunk-context=example.com@10.1.0.3;user=phone SIP/2.0</pre> <ul style="list-style-type: none"> <li><b>[0]</b> Disable = (Default) The 'tgrp' parameter isn't used.</li> <li><b>[1]</b> Send Only = The Trunk Group number or name (configured in the Hunt Group Settings) is added to the 'tgrp' parameter value in the Contact header of outgoing SIP messages. If a Trunk Group number / name is not associated with the call, the 'tgrp' parameter isn't</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                 |                         |                         |                              |                       |                               |                               |                          |                 |                         |                       |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>included. If a 'tgrp' value is specified in incoming messages, it is ignored.</p> <ul style="list-style-type: none"> <li>▪ <b>[2] Send and Receive</b> = The functionality of outgoing SIP messages is identical to the functionality described for option <b>[1]</b>. In addition, for incoming SIP INVITES, if the Request-URI includes a 'tgrp' parameter, the device routes the call according to that value (if possible). The Contact header in the outgoing SIP INVITE (Tel-to-IP call) contains "tgrp=&lt;source trunk group ID&gt;;trunk-context=&lt;gateway IP address&gt;". The &lt;source trunk group ID&gt; is the Trunk Group ID where incoming calls from Tel is received. For IP-Tel calls, the SIP 200 OK device's response contains "tgrp=&lt;destination trunk group ID&gt;;trunk-context=&lt;gateway IP address&gt;". The &lt;destination trunk group ID&gt; is the Trunk Group ID used for outgoing Tel calls. The &lt;gateway IP address&gt; in "trunk-context" can be configured using the SIPGatewayName parameter.</li> <li>▪ <b>[3] Hotline</b> = Interworks the hotline "Off Hook Indicator" parameter between SIP and ISDN: <ul style="list-style-type: none"> <li>✓ For IP-to-ISDN calls: <ul style="list-style-type: none"> <li>- The device interworks the SIP tgrp=hotline parameter (received in INVITE) to ISDN Setup with the Off Hook Indicator IE of "Voice", and "Speech" Bearer Capability IE. Note that the Off Hook Indicator IE is described in UCR 2008 specifications.</li> <li>- The device interworks the SIP tgrp=hotline-ccdata parameter (received in INVITE) to ISDN Setup with an Off Hook Indicator IE of "Data", and with "Unrestricted 64k" Bearer Capability IE. The following is an example of the INVITE with tgrp=hotline-ccdata:</li> </ul> </li> </ul> </li> </ul> <div style="background-color: #f0f0f0; padding: 5px; margin: 10px 0;"> INVITE sip:1234567;tgrp=hotline-ccdata;trunk-context=dsn.mil@example.com </div> <ul style="list-style-type: none"> <li>✓ For ISDN-to-IP calls: <ul style="list-style-type: none"> <li>- The device interworks ISDN Setup with an Off Hook Indicator of "Voice" to SIP INVITE with "tgrp=hotline;trunk-context=dsn.mil" in the Contact header.</li> <li>- The device interworks ISDN Setup with an Off Hook indicator of "Data" to SIP INVITE with "tgrp=hotline-ccdata;trunk-context=dsn.mil" in the Contact header.</li> <li>- If ISDN Setup does not contain an Off Hook Indicator IE and the Bearer Capability IE contains "Unrestricted 64k", the outgoing INVITE includes "tgrp=ccdata;trunk-context=dsn.mil". If the Bearer Capability IE contains "Speech", the INVITE in this case does not contain tgrp and trunk-context parameters.</li> </ul> </li> <li>▪ <b>[4] Hotline Extended</b> = Interworks the ISDN Setup message's hotline "OffHook Indicator" Information Element (IE) to SIP INVITE's Request-URI and Contact headers. (Note: For IP-to-ISDN calls, the device handles the call as described in option <b>[3]</b>.) <ul style="list-style-type: none"> <li>✓ The device interworks ISDN Setup with an Off Hook Indicator of "Voice" to SIP INVITE Request-URI and Contact header with "tgrp=hotline;trunk-context=dsn.mil".</li> <li>✓ The device interworks ISDN Setup with an Off Hook indicator of "Data" to SIP INVITE Request-URI and Contact header with "tgrp=hotline-ccdata;trunk-context=dsn.mil".</li> <li>✓ If ISDN Setup does not contain an Off Hook Indicator IE and the Bearer Capability IE contains "Unrestricted 64k", the outgoing INVITE Request-URI and Contact header includes "tgrp=ccdata;trunk-context=dsn.mil". If the Bearer Capability IE contains "Speech", the INVITE in this case does not contain tgrp</li> </ul> </li> </ul> |

| Parameter                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                                                                                                      | <p>A wants to transfer the call to user C. User A sends a REFER to user C:</p> <pre>REFER sip:C@domain.com SIP/2.0 From: sip:A@domain.com;tag=99asd To: sip:C@domain.com Refer-To: (URI that identifies B's UA)</pre> <p>The Refer-To header needs to contain a URI that user C can use to place a call to user B. This call needs to route to the specific UA instance that user B is using to talk to user A. User B should provide user A with a URI that has to be usable by anyone. It needs to be a GRUU.</p> <ul style="list-style-type: none"> <li>Obtaining a GRUU: The mechanism for obtaining a GRUU is through registrations. A UA can obtain a GRUU by generating a REGISTER request containing a Supported header field with the value "gruu". The UA includes a "+sip.instance" Contact header parameter of each contact for which the GRUU is desired. This Contact parameter contains a globally unique ID that identifies the UA instance. The global unique ID is created from one of the following: <ul style="list-style-type: none"> <li>✓ If the REGISTER is per the device's client (endpoint), it is the MAC address concatenated with the phone number of the client.</li> <li>✓ If the REGISTER is per device, it is the MAC address only.</li> <li>✓ When using TP, "User Info" can be used for registering per endpoint. Thus, each endpoint can get a unique id – its phone number. The globally unique ID in TP is the MAC address concatenated with the phone number of the endpoint.</li> </ul> </li> </ul> <p>If the remote server doesn't support GRUU, it ignores the parameters of the GRUU. Otherwise, if the remote side also supports GRUU, the REGISTER responses contain the "gruu" parameter in each Contact header. This parameter contains a SIP or SIPS URI that represents a GRUU corresponding to the UA instance that registered the contact. The server provides the same GRUU for the same AOR and instance-id when sending REGISTER again after registration expiration. RFC 5627 specifies that the remote target is a GRUU target if its' Contact URL has the "gr" parameter with or without a value.</p> <ul style="list-style-type: none"> <li>Using GRUU: The UA can place the GRUU in any header field that can contain a URI. It must use the GRUU in the following messages: INVITE request, its 2xx response, SUBSCRIBE request, its 2xx response, NOTIFY request, REFER request and its 2xx response.</li> </ul> |
| EMS: Is CISCO Sce Mode<br><b>[IsCiscoSCEMode]</b>                                                                    | <p>Determines whether a Cisco gateway exists at the remote side.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) No Cisco gateway exists at the remote side.</li> <li><b>[1]</b> = A Cisco gateway exists at the remote side.</li> </ul> <p>When a Cisco gateway exists at the remote side, the device must set the value of the 'annexb' parameter of the fntp attribute in the SDP to 'no'. This logic is used if the parameter EnableSilenceCompression is set to 2 (enable without adaptation). In this case, Silence Suppression is used on the channel but not declared in the SDP.</p> <p><b>Note:</b> The IsCiscoSCEMode parameter is applicable only when the selected coder is G.729.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| CLI: anonymous-mode<br><b>[AnonymousMode]</b>                                                        | <p>Determines whether the device's IP address is used as the URI host part instead of "anonymous.invalid" in the INVITE's From header for Tel-to-IP calls.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) If the device receives a call from the Tel with blocked caller ID, it sends an INVITE with From: "anonymous"&lt;anonymous@anonymous.invalid&gt;</li> <li><b>[1]</b> = The device's IP address is used as the URI host part instead of "anonymous.invalid".</li> </ul> <p>This parameter may be useful, for example, for service providers who identify their SIP Trunking customers by their source phone number or IP address, reflected in the From header of the SIP INVITE. Therefore, even customers blocking their Caller ID can be identified by the service provider. Typically, if the device receives a call with blocked Caller ID from the PSTN side (e.g., Trunk connected to a PBX), it sends an INVITE to the IP with a From header as follows: From: "anonymous"&lt;anonymous@anonymous.invalid&gt;. This is in accordance with RFC 3325. However, when this parameter is set to 1, the device replaces the "anonymous.invalid" with its IP address.</p> |

|-------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Extension<br>CLI: microsoft-ext<br><b>[EnableMicrosoftExt]</b>                                                                            | <p>received with Microsoft's proprietary "ext=xxx" parameter in the SIP INVITE URI user part. Microsoft Office Communications Server sometimes uses this proprietary parameter to indicate the extension number of the called or calling party.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>For example, if a calling party makes a call to telephone number 622125519100 Ext. 104, the device receives the SIP INVITE (from Microsoft's application) with the URI user part as INVITE sip:622125519100;ext=104@10.1.1.10 (or INVITE tel:622125519100;ext=104). If the parameter EnableMicrosoftExt is enabled, the device modifies the called number by adding an "e" as the prefix, removing the "ext=" parameter, and adding the extension number as the suffix (e.g., e622125519100<b>104</b>). Once modified, the device can then manipulate the number further, using the Number Manipulation tables to leave only the last 3 digits (for example) for sending to a PBX.</p> |

| Web: Reanswer Time<br>EMS: Regret Time<br>CLI: reanswer-time<br><b>[RegretTime]</b>                              | <p>Analog: Defines the time interval from when the user hangs up the phone until the call is disconnected (FXS). This allows the user to hang up and then pick up the phone (before this timeout) to continue the call conversation. Thus, it's also referred to as regret time.</p> <p>Digital: Defines the time period the device waits for an MFC R2 Resume (Reanswer) signal once a Suspend (Clear back) signal is received from the PBX. If this timer expires, the call is released. Note that this is applicable only to the MFC-R2 CAS Brazil variant.</p> <p>The valid range is 0 to 255 (in seconds). The default is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Web: Enable Reanswering Info<br>CLI: reans-info-enbl<br><b>[EnableReansweringINFO]</b>                           | <p>Enables the device to send a SIP INFO message with the On-Hook/Off-Hook parameter when the FXS phone goes on-hook during an ongoing call and then off-hook again, within the user-defined regret timeout (configured by the parameter RegretTime). Therefore, the device notifies the far-end that the call has been re-answered.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>This parameter is typically implemented for incoming IP-to-Tel collect calls to the FXS port. If the FXS user does not wish to accept the collect call, the user disconnects the call by on-hooking the phone. The device notifies the softswitch (or Application server) of the unanswered collect call (on-hook) by sending a SIP INFO message. As a result, the softswitch disconnects the call (sends a BYE message to the device). If the call is a regular incoming call and the FXS user on-hooks the phone without intending to disconnect the call, the softswitch does not disconnect the call (during the regret time).</p> <p>The INFO message format is as follows:</p> <pre>INFO sip:12345@10.50.228.164:5082 SIP/2.0 Via: SIP/2.0/UDP 127.0.0.1;branch=z9hG4bK_05_905924040-90579 From: &lt;sip:+551137077803@ims.acme.com.br:5080;user=phone&gt;;tag=008277765 To: &lt;sip:notavailable@unknown.invalid&gt;;tag=svw-0-1229428367 Call-ID: ConorCCR-0-LU-1229417827103300@dtas-stdn.fs5000group0-000.l CSeq: 1 INFO Contact: sip:10.20.7.70:5060 Content-Type: application/On-Hook (application/Off-Hook) Content-Length: 0</pre> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ This parameter is applicable only if the parameter RegretTime is configured.</li> <li>▪ This parameter is applicable only to FXS interfaces.</li> </ul> |
| Web: PSTN Alert Timeout<br>EMS: Trunk PSTN Alert Timeout<br>CLI: pstn-alert-timeout<br><b>[PSTNAlertTimeout]</b> | <p>Digital: Defines the Alert Timeout (in seconds) for calls sent to the PSTN. This timer is used between the time a Setup message is sent to the Tel side (IP-to-Tel call establishment) and a Connect message is received. If an Alerting message is received, the timer is restarted. If the timer expires before the call is answered, the device disconnects the call and sends a SIP 408 request timeout response to the SIP party that initiated the call.</p> <p>Analog: Defines the Alert Timeout (in seconds) for calls to the Tel side. This timer is used between the time a ring is generated (FXS) or a line is seized (FXO), until the call is connected. For example: If the FXS</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <p>Web: IP Profile Settings<br/>EMS: Protocol Definition &gt; IP Profile<br/>CLI: configure voip &gt; coders-and-profiles ip-profile<br/><b>[IPProfile]</b></p> | <p>This table parameter configures the IP Profile table. Each IP Profile ID includes a set of parameters (which are typically configured separately using their individual "global" parameters). You can later assign these IP Profiles to outbound IP routing rules (Prefix parameter), inbound IP routing rules and IP Groups.</p> <p>The format of this parameter is as follows:<br/>[IPProfile]<br/>FORMAT IpProfile_Index = IpProfile_ProfileName,<br/>IpProfile_IpPreference, IpProfile_CodersGroupID, IpProfile_IsFaxUsed,<br/>IpProfile_JitterBufMinDelay, IpProfile_JitterBufOptFactor,<br/>IpProfile_IPDiffServ, IpProfile_SigIPDiffServ, IpProfile_SCE,<br/>IpProfile_RTPRedundancyDepth, IpProfile_RemoteBaseUDPPort,<br/>IpProfile_CNGmode, IpProfile_VxxTransportType, IpProfile_NSEMode,<br/>IpProfile_IsDTMFUsed, IpProfile_PlayRBTone2IP,<br/>IpProfile_EnableEarlyMedia, IpProfile_ProgressIndicator2IP,<br/>IpProfile_EnableEchoCanceller, IpProfile_CopyDest2RedirectNumber,<br/>IpProfile_MediaSecurityBehaviour, IpProfile_CallLimit,<br/>IpProfile_DisconnectOnBrokenConnection, IpProfile_FirstTxDtmfOption,<br/>IpProfile_SecondTxDtmfOption, IpProfile_RxDTMFOption,<br/>IpProfile_EnableHold, IpProfile_InputGain, IpProfile_VoiceVolume,<br/>IpProfile_AddIEInSetup, IpProfile_SBCExtensionCodersGroupID,<br/>IpProfile_MediaIPVersionPreference, IpProfile_TranscodingMode,<br/>IpProfile_SBCAllowedCodersGroupID,<br/>IpProfile_SBCAllowedCodersMode,<br/>IpProfile_SBCMediaSecurityBehaviour,<br/>IpProfile_SBCRFC2833Behavior,<br/>IpProfile_SBCAlternativeDTMFMethod, IpProfile_SBCAssertIdentity,<br/>IpProfile_AMDSensitivityParameterSuit, IpProfile_AMDSensitivityLevel,<br/>IpProfile_AMDMaxGreetingTime,<br/>IpProfile_AMDMaxPostSilenceGreetingTime,<br/>IpProfile_SBCDiversionsMode, IpProfile_SBCHistoryInfoMode,<br/>IpProfile_EnableQSIGTunneling, IpProfile_SBCFaxCodersGroupID,<br/>IpProfile_SBCFaxBehavior, IpProfile_SBCFaxOfferMode,<br/>IpProfile_SBCFaxAnswerMode, IpProfile_SbcPrackMode,<br/>IpProfile_SBCSessionExpiresMode,<br/>IpProfile_SBCRemoteUpdateSupport,<br/>IpProfile_SBCRemoteReinviteSupport,<br/>IpProfile_SBCRemoteDelayedOfferSupport,<br/>IpProfile_SBCRemoteReferBehavior, IpProfile_SBCRemote3xxBehavior,<br/>IpProfile_SBCRemoteMultiple18xSupport,<br/>IpProfile_SBCRemoteEarlyMediaResponseType,<br/>IpProfile_SBCRemoteEarlyMediaSupport,<br/>IpProfile_EnableSymmetricMKI, IpProfile_MKISize,<br/>IpProfile_SBCEnforceMKISize, IpProfile_SBCRemoteEarlyMediaRTP,<br/>IpProfile_SBCRemoteSupportsRFC3960,<br/>IpProfile_SBCRemoteCanPlayRingback, IpProfile_EnableEarly183,<br/>IpProfile_EarlyAnswerTimeout, IpProfile_SBC2833DTMFPayloadType,<br/>IpProfile_SBCUserRegistrationTime,<br/>IpProfile_ResetSRTPStateUponRekey, IpProfile_AmdMode,<br/>IpProfile_SBCReliableHeldToneSource, IpProfile_SBCPlayHeldTone,<br/>IpProfile_SBCRemoteHoldFormat, IpProfile_DelayTimeForInvite;<br/>[IPProfile]</p> |

| Web: Tel Profile Settings<br>EMS: Protocol Definition > Telephony Profile<br>CLI: configure voip > coders-and-profiles tel-profile<br><b>[TelProfile]</b> | <p>This table parameter configures the Tel Profile table. Each Tel Profile ID includes a set of parameters (which are typically configured separately using their individual, "global" parameters). You can later assign these Tel Profile IDs to other elements such as in the Trunk Group TableEndpoint Phone Number table (TrunkGroup parameter). Therefore, Tel Profiles allow you to apply the same settings of a group of parameters to multiple channels, or apply specific settings to different channels.</p> <p>The format of this parameter is as follows:</p> <p><b>[TelProfile]</b><br/>FORMAT TelProfile_Index = TelProfile_ProfileName, TelProfile_TelPreference, TelProfile_CodersGroupID, TelProfile_IsFaxUsed, TelProfile_JitterBufMinDelay, TelProfile_JitterBufOptFactor, TelProfile_IPDiffServ, TelProfile_SigIPDiffServ, TelProfile_DtmfVolume, TelProfile_InputGain, TelProfile_VoiceVolume, TelProfile_EnableReversePolarity, TelProfile_EnableCurrentDisconnect, TelProfile_EnableDigitDelivery, TelProfile_EnableEC, TelProfile_MWIAAnalog, TelProfile_MWIDisplay, TelProfile_FlashHookPeriod, TelProfile_EnableEarlyMedia, TelProfile_ProgressIndicator2IP, TelProfile_TimeForReorderTone, TelProfile_EnableDIDWink, TelProfile_IsTwoStageDial, TelProfile_DisconnectOnBusyTone, TelProfile_EnableVoiceMailDelay, TelProfile_DialPlanIndex, TelProfile_Enable911PSAP, TelProfile_SwapTelToIpPhoneNumbers, TelProfile_EnableAGC, TelProfile_ECNlpMode, TelProfile_DigitalCutThrough, TelProfile_EnableFXODoubleAnswer, TelProfile_CallPriorityMode;<br/><b>[\TelProfile]</b></p> <p><b>Notes:</b></p> <ul style="list-style-type: none"><li>For a description of this parameter, see Configuring Tel Profiles on page <a href="#">237</a>.</li><li>For a detailed description of each parameter, see its corresponding "global" parameter.</li></ul> <table><tr><th>TelProfile Field</th><th>Web Name</th><th>Global Parameter</th></tr><tr><td>TelProfile_ProfileName</td><td>Profile Name</td><td>-</td></tr><tr><td>TelProfile_TelPreference</td><td>Profile Preference</td><td>-</td></tr><tr><td>TelProfile_CodersGroupID</td><td>Coder Group</td><td>CodersGroup0</td></tr><tr><td>TelProfile_IsFaxUsed</td><td>Fax Signaling Method</td><td>IsFaxUsed</td></tr><tr><td>TelProfile_JitterBufMinDelay</td><td>Dynamic Jitter Buffer Minimum Delay</td><td>DJBufMinDelay</td></tr><tr><td>TelProfile_JitterBufOptFactor</td><td>Dynamic Jitter Buffer Optimization Factor</td><td>DJBufOptFactor</td></tr><tr><td>TelProfile_IPDiffServ</td><td>RTP IP DiffServ</td><td>PremiumServiceClassMediaDiffServ</td></tr><tr><td>TelProfile_SigIPDiffServ</td><td>Signaling DiffServ</td><td>PremiumServiceClassControlDiffServ</td></tr></table> | TelProfile Field                   | Web Name | Global Parameter | TelProfile_ProfileName | Profile Name | - | TelProfile_TelPreference | Profile Preference | - | TelProfile_CodersGroupID | Coder Group | CodersGroup0 | TelProfile_IsFaxUsed | Fax Signaling Method | IsFaxUsed | TelProfile_JitterBufMinDelay | Dynamic Jitter Buffer Minimum Delay | DJBufMinDelay | TelProfile_JitterBufOptFactor | Dynamic Jitter Buffer Optimization Factor | DJBufOptFactor | TelProfile_IPDiffServ | RTP IP DiffServ | PremiumServiceClassMediaDiffServ | TelProfile_SigIPDiffServ | Signaling DiffServ | PremiumServiceClassControlDiffServ |

## 57.10 Channel Parameters

This subsection describes the device's channel parameters.

### 57.10.1 Voice Parameters

The voice parameters are described in the table below.

**Voice Parameters**

| Parameter                                                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web/EMS: Input Gain<br>CLI: input-gain<br><b>[InputGain]</b>                                                       | Defines the pulse-code modulation (PCM) input gain control (in decibels). This parameter sets the level for the received (Tel/PSTN-to-IP) signal.<br><br>The valid range is -32 to 31 dB. The default is 0 dB.<br><b>Note:</b> This parameter can also be configured in an IP Profile and/or a Tel Profile.                                                                                                                                                                                                                                           |
| Web: Voice Volume<br>EMS: Volume (dB)<br>CLI: voice-volume<br><b>[VoiceVolume]</b>                                 | Defines the voice gain control (in decibels). This parameter sets the level for the transmitted (IP-to-Tel/PSTN) signal.<br><br>The valid range is -32 to 31 dB. The default is 0 dB.<br><b>Note:</b> This parameter can also be configured in an IP Profile and/or a Tel Profile.                                                                                                                                                                                                                                                                    |
| EMS: Payload Format<br>CLI: G726-voice-payload-format<br><b>[VoicePayloadFormat]</b>                               | Determines the bit ordering of the G.726/G.727 voice payload format.<br><ul style="list-style-type: none"> <li>▪ <b>[0]</b> = (Default) Little Endian</li> <li>▪ <b>[1]</b> = Big Endian</li> </ul> <b>Note:</b> To ensure high voice quality when using G.726/G.727, both communicating ends should use the same endianness format. Therefore, when the device communicates with a third-party entity that uses the G.726/G.727 voice coder and voice quality is poor, change the settings of this parameter (between Big Endian and Little Endian). |
| Web: MF Transport Type<br>CLI: MF-transport-type<br><b>[MFTransportType]</b>                                       | Currently, not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Web: Enable Answer Detector<br><b>[EnableAnswerDetector]</b>                                                       | Currently, not supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Web: Answer Detector Activity Delay<br>CLI: answer-detector-activity-delay<br><b>[AnswerDetectorActivityDelay]</b> | Defines the time (in 100-msec resolution) between activating the Answer Detector and the time that the detector actually starts to operate.<br><br>The valid range is 0 to 1023. | EMS: VBR Coder Hangover<br>CLI: VBR-coder-hangover<br><b>[VBRCoderHangover]</b>               | Defines the required number of silence frames at the beginning of each silence period when using the VBR coder silence suppression.<br>The range is 0 to 255. The default is 1.                                                                                                                                                                                                                                                                          |
| Web: AMR Payload Format<br><b>[AmrOctetAlignedEnable]</b>                                     | Defines the AMR payload format type. <ul style="list-style-type: none"> <li><b>[0]</b> Bandwidth Efficient</li> <li><b>[1]</b> Octet Aligned (default)</li> </ul>                                                                                                                                                                                                                                                                                        |

### 57.10.3 DTMF Parameters

The dual-tone multi-frequency (DTMF) parameters are described in the table below.

**DTMF Parameters**

| Parameter                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web/EMS: DTMF Transport Type<br>CLI: DTMF-transport-type<br><b>[DTMFTransportType]</b> | Determines the DTMF transport type. <ul style="list-style-type: none"> <li><b>[0]</b> Mute DTMF = DTMF digits are removed from the voice stream and are not relayed to remote side.</li> <li><b>[2]</b> Transparent DTMF = DTMF digits remain in the voice stream.</li> <li><b>[3]</b> RFC 2833 Relay DTMF = (Default) DTMF digits are removed from the voice stream and are relayed to remote side according to RFC 2833.</li> <li><b>[7]</b> RFC 2833 Relay Decoder Mute = DTMF digits are sent according to RFC 2833 and muted when received.</li> </ul> |

| Parameter                                                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                     | <b>Note:</b> This parameter is automatically updated if the parameters TxDTMFOption or RxDTMFOption are configured.                                                                                                                                                                                                                                                                                                                                                     |
| Web: DTMF Volume (-31 to 0 dB)<br>EMS: DTMF Volume (dBm)<br>CLI: DTMF-volume<br><b>[DTMFVolume]</b>                 | Defines the DTMF gain control value (in decibels) to the PSTN or analog side.<br>The valid range is -31 to 0 dB. The default is -11 dB.<br><b>Note:</b> This parameter can also be configured in a Tel Profile.                                                                                                                                                                                                                                                         |
| Web: DTMF Generation Twist<br>EMS: DTMF Twist Control<br>CLI: DTMF-generation-twist<br><b>[DTMFGenerationTwist]</b> | Defines the range (in decibels) between the high and low frequency components in the DTMF signal. Positive decibel values cause the higher frequency component to be stronger than the lower one. Negative values cause the opposite effect. For any parameter value, both components change so that their average is constant.<br>The valid range is -10 to 10 dB. The default is 0 dB.<br><b>Note:</b> For this parameter to take effect, a device reset is required. |
| EMS: DTMF Inter Interval (msec)<br>CLI: inter-digit-interval<br><b>[DTMFInterDigitInterval]</b>                     | Defines the time (in msec) between generated DTMF digits to PSTN side (if TxDTMFOption = 1, 2 or 3).<br>The default is 100 msec. The valid range is 0 to 32767.                                                                                                                                                                                                                                                                                                         |
| EMS: DTMF Length (msec)<br><b>[DTMFDigitLength]</b>                                                                 | Defines the time (in msec) for generating DTMF tones to the PSTN side (if TxDTMFOption = 1, 2 or 3). It also configures the duration that is sent in INFO (Cisco) messages.<br>The valid range is 0 to 32767. The default is 100.                                                                                                                                                                                                                                       |
| EMS: Rx DTMF Relay Hang Over Time (msec)<br>CLI: default-dtmf-signal-duration<br><b>[RxDTMFHangOverTime]</b>        | Defines the Voice Silence time (in msec) after playing DTMF or MF digits to the Tel/PSTN side that arrive as Relay from the IP side.<br>Valid range is 0 to 2,000 msec. The default is 1,000 msec.                                                                                                                                                                                                                                                                      |
| EMS: Tx DTMF Relay Hang Over Time (msec)<br>CLI: digit-hangover-time-tx<br><b>[TxDTMFHangOverTime]</b>              | Defines the Voice Silence time (in msec) after detecting the end of DTMF or MF digits at the Tel/PSTN side when the DTMF Transport Type is either Relay or Mute.<br>Valid range is 0 to 2,000 msec. The default is 1,000 msec.                                                                                                                                                                                                                                          |
| Web/EMS: NTE Max Duration<br>CLI: telephony-events-max-duration<br><b>[NTEMaxDuration]</b>                          | Defines the maximum time for sending Named Telephony Events / NTEs (RFC 4733/2833 DTMF relay) to the IP side, regardless of the DTMF signal duration on the TDM side.<br>The range is -1 to 200,000,000 msec. The default is -1 (i.e., NTE stops only upon detection of an End event).                                                                                                                                                                                  |

## 57.10.4 RTP, RTCP and T.38 Parameters

The RTP, RTCP and T.38 parameters are described in the table below.

**RTP/RTCP and T.38 Parameters**

| Parameter                                                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Dynamic Jitter Buffer Minimum Delay<br>EMS: Minimal Delay (dB)<br>CLI: jitter-buffer-minimum-delay<br><b>[DJBufMinDelay]</b>      | <p>Defines the minimum delay (in msec) for the Dynamic Jitter Buffer. The valid range is 0 to 150. The default delay is 10.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>This parameter can also be configured in an IP Profile and/or a Tel Profile.</li> <li>For more information on Jitter Buffer, see Dynamic Jitter Buffer Operation on page 161.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Web: Dynamic Jitter Buffer Optimization Factor<br>EMS: Opt Factor<br>CLI: jitter-buffer-optimization-factor<br><b>[DJBufOptFactor]</b> | <p>Defines the Dynamic Jitter Buffer frame error/delay optimization factor. The valid range is 0 to 12. The default factor is 10.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>For data (fax and modem) calls, set this parameter to 12.</li> <li>This parameter can also be configured in an IP Profile and/or a Tel Profile.</li> <li>For more information on Jitter Buffer, see Dynamic Jitter Buffer Operation on page 161.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Web/EMS: Analog Signal Transport Type<br><b>[AnalogSignalTransportType]</b>                                                            | <p>Determines the analog signal transport type.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Ignore Analog Signals = (Default) Ignore.</li> <li><b>[1]</b> RFC 2833 Analog Signal Relay = Transfer hookflash using RFC 2833.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Web: RTP Redundancy Depth<br>EMS: Redundancy Depth<br>CLI: RTP-redundancy-depth<br><b>[RTPRedundancyDepth]</b>                         | <p>Enables the device to generate RFC 2198 redundant packets. This can be used for packet loss where the missing information (audio) can be reconstructed at the receiver's end from the redundant data that arrives in subsequent packets. This is required, for example, in wireless networks where a high percentage (up to 50%) of packet loss can be experienced.</p> <ul style="list-style-type: none"> <li><b>[0]</b> 0 = (Default) Disable.</li> <li><b>[1]</b> 1 = Enable - previous voice payload packet is added to current packet.</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>When enabled, you can configure the payload type, using the RFC2198PayloadType parameter.</li> <li>The RTP redundancy dynamic payload type can be included in the SDP, by using the EnableRTPRedundancyNegotiation parameter.</li> <li>This parameter can also be configured in an IP Profile.</li> </ul> |
| Web: Enable RTP Redundancy Negotiation<br>CLI: rtp-rdcy-nego-enbl<br><b>[EnableRTPRedundancyNegotiation]</b>                           | <p>Enables the device to include the RTP redundancy dynamic payload type in the SDP, according to RFC 2198.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable</li> </ul> <p>When enabled, the device includes in the SDP message the RTP payload type "RED" and the payload type configured by the parameter RFC2198PayloadType.</p> <pre>a=rtpmap:&lt;PT&gt; RED/8000</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter                                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Web/EMS: CNG Detector Mode<br>CLI: coder<br><b>[CNGDetectorMode]</b>                                                                                           | <p>Determines whether the device detects the fax calling tone (CNG).</p> <ul style="list-style-type: none"> <li><b>[0]</b> Disable = (Default) The originating device doesn't detect CNG; the CNG signal passes transparently to the remote side.</li> <li><b>[1]</b> Relay = CNG is detected on the originating side. CNG packets are sent to the remote side according to T.38 (if IsFaxUsed = 1) and the fax session is started. A SIP Re-INVITE message isn't sent and the fax session starts by the terminating device. This option is useful, for example, when the originating device is located behind a firewall that blocks incoming T.38 packets on ports that have not yet received T.38 packets from the internal network (i.e., originating device). To also send a Re-INVITE message upon detection of a fax CNG tone in this mode, set the parameter FaxCNGMode to 1 or 2.</li> <li><b>[2]</b> Events Only = CNG is detected on the originating side and a fax session is started by the originating side using the Re-INVITE message. Usually, T.38 fax session starts when the 'preamble' signal is detected by the answering side. Some SIP devices don't support the detection of this fax signal on the answering side and thus, in these cases it is possible to configure the device to start the T.38 fax session when the CNG tone is detected by the originating side. However, this mode is not recommended.</li> </ul> <p><b>Note:</b> This parameter can also be configured in an IP Profile.</p> |

This option can only be used to relay fax signals, as the device sends T.38 Re-INVITE on detection of any fax/modem Answer tone (2100 Hz, amplitude modulated 2100 Hz, or 2100 Hz with phase reversals). The modem signal fails when using T.38 for fax relay.</li> </ul> <p><b>Note:</b> This parameters is applicable only if the parameter IsFaxUsed is set to 1 (T.38 Relay) or 3 (Fax Fallback).</p> |

| Web: T38 Fax Session Immediate Start<br>CLI: t38-sess-imm-strt<br><b>[T38FaxSessionImmediateStart]</b>                                          | <p>Enables fax transmission of T.38 "no-signal" packets to the terminating fax machine.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Immediate Start on Fax = Device activates T.38 fax relay upon receipt of a re-INVITE with T.38 only in the SDP.</li> <li><b>[2]</b> Immediate Start on Fax &amp; Voice = Device activates T.38 fax relay upon receipt of a re-INVITE with T.38 and audio media in the SDP.</li> </ul> <p>This parameter is used for transmission from fax machines connected to the device and located inside a NAT. Generally, the firewall blocks T.38 (and other) packets received from the WAN, unless the device behind NAT sends at least one IP packet from the LAN to the WAN through the firewall. If the firewall blocks T.38 packets sent from the termination IP fax, the fax fails.</p> <p>To overcome this, the device sends No-Op ("no-signal") packets to open a pinhole in the NAT for the answering fax machine. The originating fax does not wait for an answer, but immediately starts sending T.38 packets to the terminating fax machine.</p> <p><b>Note:</b> To enable No-Op packet transmission, use the NoOpEnable and NoOpInterval parameters.</p> |

### 57.11.2 DTMF and Hook-Flash Parameters

The DTMF and hook-flash parameters are described in the table below.

**DTMF and Hook-Flash Parameters**

| Parameter                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hook-Flash Parameters</b>                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Web/EMS: Hook-Flash Code<br>CLI: hook-flash-code<br><b>[HookFlashCode]</b>       | For analog interfaces: Defines the digit pattern that when received from the Tel side, indicates a Hook Flash event. For digital interfaces: Defines the digit pattern used by the PBX to indicate a Hook Flash event. When this pattern is detected from the Tel side, the device responds as if a Hook Flash event has occurred and sends a SIP INFO message if the HookFlashOption parameter is set to 1, 5, 6, or 7 (indicating a Hook Flash). If configured and a Hook Flash indication is received from the IP side, the device generates this pattern to the Tel side.<br>The valid range is a 25-character string. The default is a null string.<br><b>Note:</b> This parameter can also be configured in a Tel Profile. |
| Web/EMS: Hook-Flash Option<br>CLI: hook-flash-option<br><b>[HookFlashOption]</b> | Determines the hook-flash transport type (i.e., method by which hook-flash is sent and received). For digital interfaces (E1/T1): This feature is applicable only if the HookFlashCode parameter is configured. <ul style="list-style-type: none"> <li><b>[0]</b> Not Supported = (Default) Hook-Flash indication is not sent.</li> <li><b>[1]</b> INFO = Sends proprietary INFO message (Broadsoft) with Hook-Flash indication. The device sends the INFO message as follows: <div style="background-color: #f0f0f0; padding: 5px;"> Content-Type: application/broadsoft; version=1.0<br/> Content-Length: 17<br/> event flashhook </div> </li> <li><b>[4]</b> RFC 2833 = This option is currently not supported.</li> </ul>    |

| Parameter                                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 57.11.3 Digit Collection and Dial Plan Parameters

The digit collection and dial plan parameters are described in the table below.

**Digit Collection and Dial Plan Parameters**

| Parameter                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web/EMS: Dial Plan Index<br>CLI: dial-plan-index<br><b>[DialPlanIndex]</b>                      | <p>Defines the Dial Plan index to use in the external Dial Plan file. The Dial Plan file is loaded to the device as a .dat file (converted using the DConvert utility). The Dial Plan index can be defined globally or per Tel Profile.</p> <p>The valid value range is 0 to 7, where 0 denotes PLAN1, 1 denotes PLAN2, and so on. The default is -1, indicating that no Dial Plan file is used.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ If this parameter is configured to select a Dial Plan index, the settings of the parameter DigitMapping are ignored.</li> <li>▪ If this parameter is configured to select a Dial Plan index from an external Dial Plan file, the device first attempts to locate a matching digit pattern in the Dial Plan file, and if not found, then attempts to locate a matching digit pattern in the Digit Map rules configured by the DigitMapping parameter.</li> <li>▪ This parameter is applicable also to ISDN with overlap dialing.</li> <li>▪ For E1 CAS MFC-R2 variants (which don't support terminating digit for the called party number, usually I-15), this parameter and the DigitMapping parameter are ignored. Instead, you can define a Dial Plan template per trunk using the parameter CasTrunkDialPlanName_x (or in the Trunk Settings page).</li> <li>▪ This parameter can also be configured in a Tel Profile.</li> <li>▪ For more information on the Dial Plan file, see 'Dialing Plans for Digit Collection' on page 542.</li> </ul> |
| CLI: tel2ip-src-nb-map-dial-index<br><b>[Tel2IPSourceNumberMappingDialPlanIndex]</b>            | <p>Defines the Dial Plan index in the external Dial Plan file for the Tel-to-IP Source Number Mapping feature.</p> <p>The valid value range is 0 to 7, defining the Dial Plan index <b>[Plan x]</b> in the Dial Plan file. The default is -1 (disabled).</p> <p>For more information on this feature, see 'Modifying ISDN-to-IP Calling Party Number' on page 546.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Web: Digit Mapping Rules<br>EMS: Digit Map Patterns<br>CLI: default-dm<br><b>[DigitMapping]</b> | <p>Defines the digit map pattern (used to reduce the dialing period when ISDN overlap dialing for digital interfaces). If the digit string (i.e., dialed number) matches one of the patterns in the digit map, the device stops collecting digits and establishes a call with the collected number.</p> <p>The digit map pattern can contain up to 52 options (rules), each separated by a vertical bar ( ). The maximum length of the entire digit pattern is 152 characters. The available notations include the following:</p> <ul style="list-style-type: none"> <li>▪ <b>[n-m]</b>: Range of numbers (not letters).</li> <li>▪ <b>.</b> (single dot): Repeat digits until next notation (e.g., T).</li> <li>▪ <b>x</b>: Any single digit.</li> <li>▪ <b>T</b>: Dial timeout (configured by the TimeBetweenDigits parameter).</li> <li>▪ <b>S</b>: Short timer (configured by the TimeBetweenDigits parameter; default is two seconds) that can be used when a</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter                                                                                                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                                                                      | <p>specific rule is defined after a more general rule. For example, if the digit map is 99 998, then the digit collection is terminated after the first two 9 digits are received. Therefore, the second rule of 998 can never be matched. But when the digit map is 99s 998, then after dialing the first two 9 digits, the device waits another two seconds within which the caller can enter the digit 8.</p> <p>An example of a digit map is shown below:<br/> 11xS 00T [[1-7]xxx 8xxxxxxx #xxxxxxx *xx 91xxxxxxxx 9011x.T<br/> In the example above, the last rule can apply to International numbers: 9 for dialing tone, 011 Country Code, and then any number of digits for the local number ('x').</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>For ISDN interfaces, the digit map mechanism is applicable only when ISDN overlap dialing is used (ISDNRxOverlap is set to 1).</li> <li>If the DialPlanIndex parameter is configured (to select a Dial Plan index), then the device first attempts to locate a matching digit pattern in the Dial Plan file, and if not found, then attempts to locate a matching digit pattern in the Digit Map rules configured by the DigitMapping parameter.</li> <li>For more information on digit mapping, see 'Digit Mapping' on page 344.</li> </ul> |
| Web: Max Digits in Phone Num<br>EMS: Max Digits in Phone Number<br>CLI: mxdig-b4-dialing<br><b>[MaxDigits]</b>                                       | <p>Defines the maximum number of collected destination number digits that can be received (i.e., dialed) from the Tel side (analog) when Tel-to-IP ISDN overlap dialing is performed (digital). When the number of collected digits reaches this maximum, the device uses these digits for the called destination number.</p> <p>The valid range is 1 to 49. The default is 5 for analog and 30 for digital.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>Instead of using this parameter, Digit Mapping rules can be configured.</li> <li>Dialing ends when any of the following scenarios occur: <ul style="list-style-type: none"> <li>✓ Maximum number of digits is dialed</li> <li>✓ Interdigit Timeout (TimeBetweenDigits) expires</li> <li>✓ Pound (#) key is pressed</li> <li>✓ Digit map pattern is matched</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Web: Inter Digit Timeout for Overlap Dialing <b>[sec]</b><br>EMS: Interdigit Timeout (Sec)<br>CLI: time-btwn-dial-digs<br><b>[TimeBetweenDigits]</b> | <p>For analog interfaces: Defines the time (in seconds) that the device waits between digits that are dialed by the user.</p> <p>For ISDN overlap dialing: Defines the time (in seconds) that the device waits between digits that are received from the PSTN or IP during overlap dialing.</p> <p>When this inter-digit timeout expires, the device uses the collected digits to dial the called destination number.</p> <p>The valid range is 1 to 10. The default is 4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 57.11.5 Supplementary Services Parameters

This subsection describes the device's supplementary telephony services parameters.

### 57.11.5.1 Caller ID Parameters

The caller ID parameters are described in the table below.

**Caller ID Parameters**

| Parameter                                                                                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

For FXO interfaces, the Caller ID signal is detected and sent to IP in the SIP INVITE message (as 'Display' element). For information on the Caller ID table, see Configuring Caller Display Information on page 398. To disable/enable caller ID generation per port, see Configuring Call Forward on page 399.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Web: Caller ID Type<br>EMS: Caller id Types<br>CLI: caller-ID-type<br><b>[CallerIDType]</b>                                       | <p>Determines the standard used for detection (FXO) and generation (FXS) of Caller ID, and detection (FXO) / generation (FXS) of MWI (when specified) signals:</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Standard Bellcore = (Default) Caller ID and MWI</li> <li>▪ <b>[1]</b> Standard ETSI = Caller ID and MWI</li> <li>▪ <b>[2]</b> Standard NTT</li> <li>▪ <b>[4]</b> Standard BT = Britain</li> <li>▪ <b>[16]</b> Standard DTMF Based ETSI</li> <li>▪ <b>[17]</b> Standard Denmark = Caller ID and MWI</li> <li>▪ <b>[18]</b> Standard India</li> <li>▪ <b>[19]</b> Standard Brazil</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ Typically, the Caller ID signals are generated/detected between the first and second rings. However, sometimes the Caller ID is detected before the first ring signal. In such a scenario, set the RingsBeforeCallerID parameter to 0.</li> <li>▪ Caller ID detection for Britain <b>[4]</b> is not supported on the device's FXO ports. Only FXS ports can generate the Britain <b>[4]</b> Caller ID.</li> <li>▪ To select the Bellcore Caller ID sub standard, use the BellcoreCallerIDTypeOneSubStandard parameter. To select the ETSI Caller ID substandard, use the ETSICallerIDTypeOneSubStandard parameter.</li> <li>▪ To select the Bellcore MWI sub standard, use the BellcoreVMWITypeOneStandard parameter. To select the ETSI MWI sub standard, use the ETSIVMWITypeOneStandard parameter.</li> <li>▪ If you define Caller ID Type as NTT <b>[2]</b>, you need to define the NTT DID signaling form (FSK or DTMF) using the NTTDIDSignallingForm parameter.</li> </ul> |
| Web: Enable FXS Caller ID Category Digit For Brazil Telecom<br>CLI: fxs-callid-cat-brazil<br><b>[AddCPCPrefix2BrazilCallerID]</b> | <p>Enables the interworking of Calling Party Category (cpc) code from SIP INVITE messages to FXS Caller ID first digit.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>When this parameter is enabled, the device sends the Caller ID number (calling number) with the cpc code (received in the SIP INVITE message) to the device's FXS port. The cpc code is added as a prefix to the caller ID (after IP-to-Tel calling number manipulation). For example, assuming that the incoming INVITE contains the following</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Web: Asserted Identity Mode<br>EMS: Asserted ID Mode<br>CLI: asserted-identity-m<br><b>[AssertedIdMode]</b> | <p>Determines whether the SIP header P-Asserted-Identity or P-Preferred-Identity is used in the generated SIP INVITE, 200 OK, or UPDATE request for Caller ID (or privacy). These headers are used to present the originating party's Caller ID. The Caller ID is composed of a Calling Number and a Calling Name (optional).</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disabled = (Default) P-Asserted-Identity nor P-Preferred-Identity headers are not added.</li> <li>▪ <b>[1]</b> Add P-Asserted-Identity</li> <li>▪ <b>[2]</b> Add P-Preferred-Identity</li> </ul> <p>The header used also depends on the calling Privacy (allowed or restricted). These headers are used together with the Privacy header. If Caller ID is restricted (i.e., P-Asserted-Identity is not sent), the Privacy header includes the value 'id' ('Privacy: id'). Otherwise, for allowed Caller ID, 'Privacy: none' is used. If Caller ID is restricted (received from PSTN / Tel or configured in the device), the From header is set to &lt;anonymous@anonymous.invalid&gt;.</p> <p>The 200 OK response can contain the connected party CallerID - Connected Number and Connected Name. For example, if the call is answered by the device, the 200 OK response includes the P-Asserted-Identity with Caller ID. The device interworks (in some ISDN variants), the Connected Party number and name from Q.931 Connect message to SIP 200 OK with the P-Asserted-Identity header. In the opposite direction, if the ISDN device receives a 200 OK with P-Asserted-Identity header, it interworks it to the Connected party number and name in the Q.931 Connect message, including its privacy.</p> |
| Web/EMS: Use Destination As Connected Number<br><b>[UseDestinationAsConnectedNumber]</b>                    | <p>Enables the device to include the Called Party Number, from outgoing Tel calls (after number manipulation), in the SIP P-Asserted-Identity header. The device includes the SIP P-Asserted-Identity header in 180 Ringing and 200 OK responses for IP-to-Tel calls.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ For this feature, you must also enable the device to include the P-Asserted-Identity header in 180/200 OK responses, by setting the parameter AssertedIDMode to <b>Add P-Asserted-Identity</b>.</li> <li>▪ If the received Q.931 Connect message contains a Connected Party Number, this number is used in the P-Asserted-Identity header in 200 OK response.</li> <li>▪ This parameter is applicable to ISDN, CAS, and/or FXO interfaces.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Web/EMS: Enable Hold<br>CLI: hold<br><b>[EnableHold]</b>                                                        | <p>For digital interfaces: Enables interworking of the Hold/Retrieve supplementary service from PRI to SIP.</p> <p>For analog interfaces: Enables the Call Hold feature that allows users, connected to the device, to place a call on hold (or remove from hold). This is done using the phone's Hook Flash button. On receiving a hold request, the remote party is placed on hold and hears the hold tone.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable</li> <li>▪ <b>[1]</b> Enable (default)</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ For digital interfaces: To support interworking of the Hold/Retrieve supplementary service from SIP to ISDN (for QSIG and Euro ISDN), set the parameter EnableHold2ISDN to 1.</li> <li>▪ For analog interfaces: To use this service, the devices at both ends must support this option.</li> <li>▪ This parameter can also be configured in an IP Profile.</li> </ul> |
| Web/EMS: Hold Format<br>CLI: hold-format<br><b>[HoldFormat]</b>                                                 | <p>Determines the format of the SDP in the Re-INVITE hold request.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> 0.0.0.0 = (Default) The SDP "c=" field contains the IP address "0.0.0.0" and the "a=inactive" attribute.</li> <li>▪ <b>[1]</b> Send Only = The SDP "c=" field contains the device's IP address and the "a=sendonly" attribute.</li> <li>▪ <b>[2]</b> x.y.z.t = The SDP "c=" field contains the device's IP address and the "a=inactive" attribute.</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ The device does not send any RTP packets when it is in hold state.</li> <li>▪ For digital interfaces: This parameter is applicable only to QSIG and Euro ISDN protocols.</li> </ul>                                                                                                                                                                                                                          |
| Web/EMS:Held Timeout<br>CLI: held-timeout<br><b>[HeldTimeout]</b>                                               | <p>Defines the time interval that the device allows for a call to remain on hold. If a Resume (un-hold Re-INVITE) message is received before the timer expires, the call is renewed. If this timer expires, the call is released (terminated).</p> <ul style="list-style-type: none"> <li>▪ <b>[-1]</b> = (Default) The call is placed on hold indefinitely until the initiator of the on hold retrieves the call again.</li> <li>▪ <b>[0 - 2400]</b> = Time to wait (in seconds) after which the call is released.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Web: Call Hold<br>Reminder Ring Timeout<br>EMS: CHRRTIMEOUT<br>CLI: call-hold-remnd-rng<br><b>[CHRRTIMEOUT]</b> | <p>Defines the duration (in seconds) that the Call Hold Reminder Ring is played. If a user hangs up while a call is still on hold or there is a call waiting, then the FXS interface immediately rings the extension for the duration specified by this parameter. If the user off-hooks the phone, the call becomes active.</p> <p>The valid range is 0 to 600. The default is 30.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ This parameter is applicable only to FXS interfaces.</li> <li>▪ This Reminder Ring feature can be disabled using the DisableReminderRing parameter.</li> </ul>                                                                                                                                                                                                                                                                                                                                                |
| CLI: dis-reminder-ring                                                                                          | Disables the reminder ring, which notifies the FXS user of a call on hold                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameter                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>[DisableReminderRing]</b>                         | <p>or a waiting call when the phone is returned to on-hook position.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) The reminder ring feature is active. In other words, if a call is on hold or there is a call waiting and the phone is changed from offhook to onhook, the phone rings (for a duration defined by the CHRRTimeout parameter) to "remind" you of the call hold or call waiting.</li> <li><b>[1]</b> = Disables the reminder ring. If a call is on hold or there is a call waiting and the phone is changed from offhook to onhook, the call is released (and the device sends a SIP BYE to the IP).</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>This parameter is applicable only to FXS interfaces.</li> <li>This parameter is typically used for MLPP, allowing preemption to clear held calls.</li> </ul> |
| CLI: dtmf-during-hold<br><b>[PlayDTMFduringHold]</b> | <p>Determines whether the device sends DTMF signals (or DTMF SIP INFO message) when a call is on hold.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) Disable.</li> <li><b>[1]</b> = Enable - If the call is on hold, the device stops playing the Held tone (if it is played) and sends DTMF: <ul style="list-style-type: none"> <li>✓ To Tel side: plays DTMF digits according to the received SIP INFO message(s). (The stopped held tone is not played again.)</li> <li>✓ To IP side: sends DTMF SIP INFO messages to an IP destination if it detects DTMF digits from the Tel side.</li> </ul> </li> </ul>                                                                                                                                                                                                                                           |

#### 57.11.5.6 Call Transfer Parameters

The call transfer parameters are described in the table below.

**Call Transfer Parameters**

| Parameter                                                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web/EMS: Enable Transfer<br>CLI: enable-transfer<br><b>[EnableTransfer]</b>                                     | <p>Enables the Call Transfer feature.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Disable</li> <li><b>[1]</b> Enable = (Default) The device responds to a REFER message with the Referred-To header to initiate a call transfer. For analog interfaces: If the transfer service is enabled, the user can activate Transfer using hook-flash signaling. If this service is enabled, the remote party performs the call transfer.</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>To use call transfer, the devices at both ends must support this option.</li> <li>To use call transfer, set the parameter EnableHold to 1.</li> </ul> |
| Web: Transfer Prefix<br>EMS: Logical Prefix For Transferred Call<br>CLI: transfer-prefix<br><b>[xferPrefix]</b> | <p>Defines the string that is added as a prefix to the transferred/forwarded called number when the REFER/3xx message is received.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>The number manipulation rules apply to the user part of the Refer-To and/or Contact URI before it is sent in the INVITE message.</li> <li>This parameter can be used to apply different manipulation rules to differentiate transferred/forwarded (only for analog interfaces) number from the originally dialed number.</li> </ul>                                                                                                                                 |

| Parameter                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Transfer Prefix IP 2 Tel<br>CLI: xfer-prefix-ip2tel<br><b>[XferPrefixIP2Tel]</b>                         | <p>Defines the prefix that is added to the destination number received in the SIP Refer-To header (for IP-to-Tel calls). This parameter is applicable to FXO/CAS blind transfer modes, i.e., LineTransferMode = 1, 2 or 3, and TrunkTransferMode = 1 or 3 (for CAS).</p> <p>The valid range is a string of up to 9 characters. The default is an empty string.</p> <p><b>Note:</b> This parameter is also applicable to ISDN Blind Transfer, according to AT&amp;T Toll Free Transfer Connect Service (TR 50075) "Courtesy Transfer-Human-No Data". To support this transfer mode, you need to configure the parameter XferPrefixIP2Tel to "*8" and the parameter TrunkTransferMode to 5.</p>                                                                                                                                                                                                                                                                                     |
| Web/EMS: Enable Semi-Attended Transfer<br>CLI: semi-att-transfer<br><b>[EnableSemiAttendedTransfer]</b>       | <p>Determines the device behavior when Transfer is initiated while in Alerting state.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Disable = (Default) Send REFER with the Replaces header.</li> <li><b>[1]</b> Enable = Send CANCEL, and after a 487 response is received, send REFER without the Replaces header.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Web: Blind<br>EMS: Blind Transfer<br>CLI: blind-transfer<br><b>[KeyBlindTransfer]</b>                         | <p>Defines the keypad sequence to activate blind transfer for established Tel-to-IP calls. The Tel user can perform blind transfer by dialing the KeyBlindTransfer digits, followed by a transferee destination number.</p> <p>After the KeyBlindTransfer DTMF digits sequence is dialed, the current call is put on hold (using a Re-INVITE message), a dial tone is played to the channel, and then the phone number collection starts.</p> <p>After the destination phone number is collected, it is sent to the transferee in a SIP REFER request in a Refer-To header. The call is then terminated and a confirmation tone is played to the channel. If the phone number collection fails due to a mismatch, a reorder tone is played to the channel.</p> <p><b>Note:</b> For FXS/FXO interfaces, it is possible to configure whether the KeyBlindTransfer code is added as a prefix to the dialed destination number, by using the parameter KeyBlindTransferAddPrefix.</p> |
| EMS: Blind Transfer Add Prefix<br>CLI: blind-xfer-add-prefix<br><b>[KeyBlindTransferAddPrefix]</b>            | <p>Determines whether the device adds the Blind Transfer code (defined by the KeyBlindTransfer parameter) to the dialed destination number.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable</li> </ul> <p><b>Note:</b> This parameter is applicable only to FXO and FXS interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| EMS: Blind Transfer Disconnect Timeout<br>CLI: blind-xfer-disc-tmo<br><b>[BlindTransferDisconnectTimeout]</b> | <p>Defines the duration (in milliseconds) for which the device waits for a disconnection from the Tel side after the Blind Transfer Code (KeyBlindTransfer) has been identified. When this timer expires, a SIP REFER message is sent toward the IP side. If this parameter is set to 0, the REFER message is immediately sent.</p> <p>The valid value range is 0 to 1,000,000. The default is 0.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Web: Use Different RTP port After Hold<br>CLI: use-different-rtp-port-after-hold<br><b>[UseDifferentRTPportAfterHold]</b> | <p>Enables the use of different RTP ports for the two calls involved in a three-way conference call made by the FXS endpoint in the initial outgoing INVITE requests.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable = First and second calls use the same RTP port in the initial outgoing INVITE request. If a three-way conference is then made, the device sends a re-INVITE to the held call to retrieve it and to change the RTP port to a different port number.</li> </ul> <p>For example: The first call is made on port 6000 and placed on hold. The second call is made, also on port 6000. The device sends a re-INVITE to the held call to retrieve it and changes the port to 6010.</p> <ul style="list-style-type: none"> <li>▪ <b>[1]</b> Enable = First and second calls use different RTP ports in the initial outgoing INVITE request. If a three-way conference is then made, the device sends a re-INVITE to the held call to retrieve it, without changing the port of the held call.</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When this feature is enabled and only one RTP port is available, only one call can be made by the FXS endpoint, as there is no free RTP port for a second call.</li> <li>▪ When this feature is enabled and you are using the Call Forking feature, every forked call is sent with a different RTP port. As the device can fork a call to up to 10 destinations, the device requires at least 10 free RTP ports.</li> <li>▪ This parameter is applicable only to FXS interfaces.</li> </ul> |

#### 57.11.5.8 MLPP and Emergency Call Parameters

The Multilevel Precedence and Preemption (MLPP) and emergency E911 call parameters are described in the table below.

**MLPP and Emergency E911 Call Parameters**

| Parameter                                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web/EMS: Call Priority Mode<br>CLI: call-prio-mode<br><b>[CallPriorityMode]</b> | <p>Enables priority call handling for all calls.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default).</li> <li>▪ <b>[1]</b> MLPP = MLPP Priority Call handling is enabled. MLPP prioritizes call handling whereby the relative importance of various kinds of communications is strictly defined, allowing higher precedence communication at the expense of lower precedence communications. Higher priority calls override less priority calls when, for example, congestion occurs in a network.</li> </ul> |

| Web/EMS: Emergency Numbers<br>CLI: emerg-nbs<br><b>[EmergencyNumbers]</b>                                                               | <p>Defines a list of “emergency” numbers.</p> <p>For FXS: When one of these numbers is dialed, the outgoing INVITE message includes the SIP Priority and Resource-Priority headers. If the user places the phone on-hook, the call is not disconnected. Instead, a Hold Re-INVITE request is sent to the remote party. Only if the remote party disconnects the call (i.e., a BYE is received) or a timer expires (set by the EmergencyRegretTimeout parameter) is the call terminated.</p> <p>For FXO, CAS, and ISDN: These emergency numbers are used for the preemption of E911 IP-to-Tel calls when there are unavailable or busy channels. In this scenario, the device terminates one of the busy channels and sends the emergency call to this channel. This feature is enabled by setting the CallPriorityMode parameter to 2 (“Emergency”). For a description of this feature, see ‘Pre-empting Existing Call for E911 IP-to-Tel Call’ on page <a href="#">369</a>.</p> <p>The list can include up to four different numbers, where each number can be up to four digits long.</p> <p>Example: EmergencyNumbers = ‘100’, ‘911’, ‘112’</p> |
| Web: Emergency Calls Regret Timeout<br>EMS: Emergency Regret Timeout<br>CLI: emerg-calls-regrt-t-out<br><b>[EmergencyRegretTimeout]</b> | <p>Defines the time (in minutes) that the device waits before tearing-down an emergency call (defined by the parameter EmergencyNumbers). Until this time expires, an emergency call can only be disconnected by the remote party, typically, by a Public Safety Answering Point (PSAP). The valid range is 1 to 30. The default is 10.</p> <p><b>Note:</b> This parameter is applicable only to FXS interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <p><b>Multiple Differentiated Services Code Points (DSCP) per MLPP Call Priority Level (Precedence) Parameters</b></p> <p>The MLPP service allows placement of priority calls, where properly validated users can preempt (terminate) lower-priority phone calls with higher-priority calls. For each MLPP call priority level, the DSCP can be set to a value from 0 to 63. The Resource Priority value in the Resource-Priority SIP header can be one of the following:</p> <table> <tr> <th>MLPP Precedence Level</th><th>Precedence Level in Resource-Priority SIP Header</th></tr> <tr> <td>0 (lowest)</td><td>routine</td></tr> <tr> <td>2</td><td>priority</td></tr> <tr> <td>4</td><td>immediate</td></tr> <tr> <td>6</td><td>flash</td></tr> <tr> <td>8</td><td>flash-override</td></tr> <tr> <td>9 (highest)</td><td>flash-override-override</td></tr> </table> |                                                                                                                                                                                                                                                                                                     | MLPP Precedence Level | Precedence Level in Resource-Priority SIP Header | 0 (lowest) | routine | 2 | priority | 4 | immediate | 6 | flash | 8 | flash-override | 9 (highest) | flash-override-override |

| Web: Enable Calls Cut Through<br>EMS: Cut Through<br>CLI: calls-cut-through<br><b>[CutThrough]</b> | <p>Enables FXS endpoints to receive incoming IP calls while the port is in off-hook state.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>If enabled, the FXS interface answers the call and 'cuts through' the voice channel if there is no other active call on the port, even if the port is in off-hook state.</p> <p>When the call is terminated (by the remote IP party), the device plays a reorder tone for a user-defined time (configured by the CutThroughTimeForReorderTone parameter) and is then ready to answer the next incoming call without on-hooking the phone.</p> <p>The waiting call is automatically answered by the device when the current call is terminated (configured by setting the parameter EnableCallWaiting to 1).</p> <p><b>Note:</b> This feature is applicable only to FXS interfaces.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CLI: cut-through-anable<br><b>[DigitalCutThrough]</b>                                              | <p>Enables PSTN CAS channels/endpoints to receive incoming IP calls even if the B-channels are in off-hook state.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disabled (default)</li> <li>▪ <b>[1]</b> Enabled</li> </ul> <p>When enabled, this feature operates as follows:</p> <ol style="list-style-type: none"> <li>4 A Tel-to-IP call is established (connected) by the device for a B-channel.</li> <li>5 The device receives a SIP BYE (i.e., IP side ends the call) and plays a reorder tone to the PSTN side for the duration set by the CutThroughTimeForReOrderTone parameter. The device releases the call towards the IP side (sends a SIP 200 OK).</li> <li>6 The PSTN side, for whatever reason, remains off-hook.</li> <li>7 If a new IP call is received for this B-channel after the reorder tone has ended, the device "cuts through" the channel and connects the call immediately (despite the B-channel being in physical off-hook state) without playing a ring tone. If an IP call is received while the reorder tone is played, the device rejects the call.</li> </ol> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ If this parameter is disabled and the PSTN side remains in off-hook state after the IP call ends the call, the device releases the call after 60 seconds.</li> <li>▪ A special CAS table can be used to report call status events (Active/Idle) to the PSTN side during Cut Through mode.</li> <li>▪ This feature can also be configured in a Tel Profile and therefore, assigned to specific B-channels that use specific CAS tables.</li> </ul> |

### 57.11.5.10 Automatic Dialing Parameters

The automatic dialing upon off-hook parameters are described in the table below.

**Automatic Dialing Parameters**

| Parameter                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                              | <p>Enable911PSAP parameter is set to 1.</p> <ul style="list-style-type: none"> <li><b>[2] Double Wink</b> = Double-wink signaling. The FXS interface generates the first wink upon detection of an off-hook state in the line. The second wink is generated after a user-defined interval (configured by the TimeBetweenDIDWinks parameter), after which the DTMF/MF digits are collected by the device. Digits that arrive between the first and second wink are ignored as they contain the same number.<br/>Example: (Wink) KP 911 ST (Wink) KP I(l) xxx-xxxx ST (Off Hook)</li> <li><b>[3] Wink &amp; Polarity</b>= The FXS interface generates the first wink after it detects an off-hook state. A polarity change from normal to reversed is generated after a user-defined time (configured by the TimeBetweenDIDWinks parameter). DTMF/MF digits are collected only after this polarity change. Digits that arrive between the first wink and the polarity change are ignored as they always contain the same number. In this mode, the FXS interface does not generate a polarity change to normal if the Tel-to-IP call is answered by an IP party. Polarity reverts to normal when the call is released.<br/>Example: (Wink) KP 911 ST (Polarity) KP I(l) xxx-xxxx ST (Off Hook)</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>Options [2] and [3] are applicable only to FXS interfaces.</li> <li>The EnableReversalPolarity and PolarityReversalType parameters must be set to [1] for FXS interfaces.</li> <li>See also the Enable911PSAP parameter.</li> <li>This parameter can also be configured in a Tel Profile.</li> </ul> |
| <b>[TimeBetweenDIDWinks]</b>                                                                 | <p>Defines the interval (in msec) for wink signaling:</p> <ul style="list-style-type: none"> <li>Double-wink signaling [2]: interval between the first and second wink.</li> <li>Wink and Polarity signaling [3]: interval between wink and polarity change.</li> </ul> <p>The valid range is 100 to 2000. The default is 1000.</p> <p><b>Note:</b> See the EnableDIDWink parameter for configuring the wink signaling type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### 57.11.6 PSTN Parameters

This subsection describes the device's PSTN parameters.

#### 57.11.6.1 General Parameters

The general PSTN parameters are described in the table below.

**General PSTN Parameters**

| Parameter                                                 | Description                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web/EMS: Protocol Type<br>CLI: protocol<br>[ProtocolType] | Defines the PSTN protocol for all the Trunks. To configure the protocol type for a specific Trunk, use the <i>ini</i> file parameter ProtocolType_x:<br><ul style="list-style-type: none"> <li>[0] NONE</li> <li>[1] E1 EURO ISDN = ISDN PRI Pan-European (CTR4)</li> </ul> |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>[ProtocolType_x]</b>   | Defines the protocol type for a specific trunk ID (where x denotes the Trunk ID and 0 is the first trunk). For more information, see the ProtocolType parameter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>[ISDNTimerT310]</b>    | <p>Defines the T310 override timer for DMS, Euro ISDN, and ISDN NI2 variants. An ISDN timer is started when a Q.931 Call Proceeding message is received. The timer is stopped when a Q.931 Alerting, Connect, or Disconnect message is received from the other end. If no ISDN Alerting, Progress, or Connect message is received within the duration of T310 timer, the call clears.</p> <p>The valid value range is 0 to 600 seconds. The default is 0 (i.e., use the default timer value according to the protocol's specifications).</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ For this parameter to take effect, a device reset is required.</li> <li>▪ When both the parameters ISDNDmsTimerT310 and ISDNTimerT310 are configured, the value of the parameter ISDNTimerT310 prevails.</li> </ul> |
| <b>[ISDNDMSTimerT310]</b> | <p>Defines the override T310 timer for the DMS-100 ISDN variant. T310 defines the timeout between the receipt of a Proceeding message and the receipt of an Alerting/Connect message.</p> <p>The valid range is 10 to 30. The default is 10 (seconds).</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ Instead of configuring this parameter, it is recommended to use the parameter ISDNTimerT310.</li> <li>▪ This parameter is applicable only to Nortel DMS and Nortel MERIDIAN PRI variants (ProtocolType = 14 and 35).</li> </ul>                                                                                                                                                                                                                                                                       |
| <b>[ISDNTimerT301]</b>    | <p>Defines the override T301 timer (in seconds). The T301 timer is started when a Q.931 Alert message is received. The timer is stopped when a Q.931 Connect/Disconnect message is received from the other side. If no Connect or Disconnect message is received within the duration of T301, the call is cleared.</p> <p>The valid range is 0 to 2400. The default is 0 (i.e., the default T301 timer value - 180 seconds - is used). If set to any other value than 0, it overrides the timer with this value.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ For this parameter to take effect, a device reset is required.</li> </ul>                                                                                                                                                                   |

| Parameter                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### 57.11.6.3 CAS Parameters

The Common Channel Associated (CAS) parameters are described in the table below. Note that CAS is not applicable to BRI interfaces.

#### CAS Parameters

| Parameter                                                                                                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: CAS Transport Type<br>EMS: CAS Relay Transport Mode<br>CLI: CAS-transport-type<br><b>[CASTransportType]</b> | Determines the ABCD signaling transport type over IP. <ul style="list-style-type: none"> <li><b>[0]</b> CAS Events Only = (Default) Disable CAS relay.</li> <li><b>[1]</b> CAS RFC2833 Relay = Enable CAS relay mode using RFC 2833.</li> </ul> The CAS relay mode can be used with the TDM tunneling feature to enable tunneling over IP for both voice and CAS signaling bearers.                                                                                                                                             |
| <b>[CASAddressingDelimiters]</b>                                                                                 | Enables the addition of delimiters to the received address or received ANI digits string. <ul style="list-style-type: none"> <li><b>[0]</b> = (default) Disable. The address and ANI strings remain without delimiters.</li> <li><b>[1]</b> = Enable. Delimiters such as '*', '#', and 'ST' are added to the received address or received ANI digits string.</li> </ul>                                                                                                                                                         |
| CLI: cas-delimiters-types<br><b>[CASDelimitersPaddingUsage]</b>                                                  | Defines the digits string delimiter padding usage per trunk. <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) Default address string padding: '*XXX#' (where XXX is the digit string that begins with '*' and ends with '#', when using padding).</li> <li><b>[1]</b> = Special use of asterisks delimiters: '*XXX*YYY*' (where XXX is the address, YYY is the source phone number, and '*' is the only delimiter padding).</li> </ul> <b>Note:</b> For this parameter to take effect, a device reset is required. |
| Web: CAS Table per Trunk<br>EMS: Trunk CAS Table Index<br>CLI: cas-table-index<br><b>[CASTableIndex_x]</b>       | Defines the CAS protocol per trunk from a list of CAS protocols defined by the parameter CASFileName_x.<br>For example, the below configuration specifies Trunks 0 and 1 to use the E&M Winkstart CAS (E_M_WinkTable.dat) protocol, and Trunks 2 and 3 to use the E&M Immediate Start CAS (E_M_ImmediateTable.dat) protocol:<br><pre>CASFileName_0 = 'E_M_WinkTable.dat'</pre>                                                                                                                                                  |

| Parameter                                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>[CASFileName_x]</b>                                                                              | <p>Defines the CAS file name (e.g., 'E_M_WinkTable.dat') that defines the CAS protocol, where x denotes the CAS file ID (0-7). It is possible to define up to eight different CAS files by repeating this parameter. Each CAS file can be associated with one or more of the device's trunks, using the parameter CASTableIndex_x.</p> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Web/EMS: CAS Table per Channel<br>CLI: cas-channel-index<br><b>[CASChannelIndex]</b>                | <p>Defines the loaded CAS protocol table index per B-channel pertaining to a CAS trunk. This parameter is assigned a string value and can be set in one of the following two formats:</p> <ul style="list-style-type: none"> <li><b>CAS table per channel:</b> Each channel is separated by a comma and the value entered denotes the CAS table index used for that channel. The syntax is &lt;CAS index&gt;,&lt;CAS index&gt; (e.g., "1,2,1,2..."). For this format, 31 indices must be defined for E1 trunks (including dummy for B-channel 16), or 24 indices for T1 trunks. Below is an example for configuring a T1 CAS trunk (Trunk 5) with several CAS variants: <pre>ProtocolType_5 = 7</pre> <pre>CASFILENAME_0='E_M_FGBWinkTable.dat'</pre> <pre>CASFILENAME_1='E_M_FGDWinkTable.dat'</pre> <pre>CASFILENAME_2='E_M_WinkTable.txt'</pre> <pre>CasChannelIndex_5 =</pre> <pre>'0,0,0,1,1,1,2,2,2,0,0,0,1,1,1,0,1,2,0,2,1,2,2</pre> <pre>,2'</pre> <pre>CASDelimitersPaddingUsage_5 = 1</pre> </li> <li><b>CAS table per channel group:</b> Each channel group is separated by a colon and each channel is separated by a comma. The syntax is &lt;x-y channel range&gt;:&lt;CAS table index&gt;, (e.g., "1-10:1,11-31:3"). Every B-channel (including 16 for E1) must belong to a channel group. Below is an example for configuring an E1 CAS trunk (Trunk 5) with several CAS variants:</li> </ul> |

#### 57.11.6.4 ISDN Parameters

The ISDN parameters are described in the table below.

**ISDN Parameters**

| Parameter                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: ISDN Termination Side<br>EMS: Termination Side<br>CLI: isdn-termination-side<br>[TerminationSide] | <p>Determines the ISDN termination side.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> User side = (Default) ISDN User Termination Equipment (TE) side.</li> <li>▪ <b>[1]</b> Network side = ISDN Network Termination (NT) side.</li> </ul> <p><b>Note:</b> Select 'User side' when the PSTN or PBX side is configured as 'Network side' and vice versa. If you don't know the device's ISDN termination side, choose 'User side'. If the D-channel alarm is indicated, choose 'Network Side'.</p> <p>The BRI module supports the ITU-T I.430 standard, which defines the ISDN-BRI layer 1 specification. The BRI and PRI ports are configured similarly, using this parameter. When an NT port is active, it drives a 38-V line and sends an INFO1 signal (as defined in ITU-T I.430 Table 4) on the data line to synchronize to a TE port that might be connected to it. To stop the voltage and the INFO1 signal on the line, stop the trunk using the Stop Trunk button.</p> |
| [TerminationSide_x]                                                                                    | Same as the description for parameter TerminationSide, but for a specific trunk ID (where x denotes the Trunk ID and 0 is the first Trunk).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>ISDN Flexible Behavior Parameters</b><br>ISDN protocol is implemented in different switches/PBXs by different vendors. Several implementations may vary slightly from the specification. Therefore, to provide a flexible interface that supports these ISDN variants, the ISDN behavior parameters can be used. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Web/EMS: Incoming Calls Behavior<br>CLI: isdn-bits-incoming-calls-behavior<br><b>[ISDNInCallsBehavior]</b>                                                                                                                                                                                                          | <p>Determines the bit-field used to determine several behavior options that influence how the ISDN Stack INCOMING calls behave.</p> <ul style="list-style-type: none"> <li>▪ <b>[32]</b> DATA CONN RS = The device automatically sends a Q.931 Connect (answer) message on incoming Tel calls (Q.931 Setup).</li> <li>▪ <b>[64]</b> VOICE CONN RS = The device sends a Connect (answer) message on incoming Tel calls.</li> <li>▪ <b>[2048]</b> CHAN ID IN FIRST RS = (Default) The device sends Channel ID in the first response to an incoming Q.931 Call Setup message. Otherwise, the Channel ID is sent only if the device requires changing the proposed Channel ID.</li> <li>▪ <b>[4096]</b> USER SETUP ACK = The Setup Ack message is sent by the SIP Gateway application layer and not automatically by the PSTN stack. By default, this bit is set.</li> <li>▪ <b>[8192]</b> CHAN ID IN CALL PROC = The device sends Channel ID in a Q.931 Call Proceeding message.</li> <li>▪ <b>[65536]</b> PROGR IND IN SETUP ACK = The device includes Progress Indicator (PI=8) in Setup Ack message if an empty called number is received in an incoming Setup message. This option is applicable to the overlap dialing mode. The device also plays a dial tone (for TimeForDialTone) until the next called number digits are received. By default, this bit is set.</li> <li>▪ <b>[2147483648]</b> USER SCREEN INDICATOR = When the device receives two Calling Number IE's in the Setup message, the device, by default, uses only one of the numbers according to the following:               <ul style="list-style-type: none"> <li>✓ Network provided, Network provided - the first calling number is used</li> <li>✓ Network provided, User provided: the first one is used</li> <li>✓ User provided, Network provided: the second one is used</li> <li>✓ User provided, user provided: the first one is used</li> </ul> </li> </ul> <p>When this bit is configured, the device behaves as follows:</p> <ul style="list-style-type: none"> <li>✓ Network provided, Network provided: the first calling number is used</li> <li>✓ Network provided, User provided: the second one is used</li> <li>✓ User provided, Network provided: the first one is used</li> <li>✓ User provided, user provided: the first one is used</li> </ul> <p><b>Note:</b> When using the <i>ini</i> file to configure the device to support several ISDNInCallsBehavior features, enter a summation of the individual feature values. For example, to support both <b>[2048]</b> and <b>[65536]</b> features, set ISDNInCallsBehavior = 67584 (i.e., 2048 + 65536).</p> |

|                                                                                                                                                            | number of the ISDN Setup message, and the destination subaddress in this ISDN Setup message then contains y digits from the end of the called number. The y number of digits can be configured using the ISUBNumberOfDigits parameter. The default value of ISUBNumberOfDigits is 0, thus, if this parameter is not configured, and 1) and 2) scenarios (described above) have not provided an isub value, the subaddress remains empty.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Web: Default Cause Mapping From ISDN to SIP<br>CLI: dflt-cse-map-isdn2sip<br><b>[DefaultCauseMapISDN2IP]</b>                                               | Defines a single default ISDN release cause that is used (in ISDN-to-IP calls) instead of all received release causes, except when the following Q.931 cause values are received: Normal Call Clearing (16), User Busy (17), No User Responding (18), or No Answer from User (19). The range is any valid Q.931 release cause (0 to 127). The default is 0 (i.e., not configured - static mapping is used).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

For RLT, the transfer is always done after receipt of Connect (SendISDNTransferOnConnect is set to 1).</p> <ul style="list-style-type: none"> <li>✓ This transfer can be performed between B-channels from different trunks or Trunk Groups, by using the parameter EnableTransferAcrossTrunkGroups.</li> <li>✓ The device initiates the ECT process after receiving a SIP REFER message only for trunks that are configured to User side.</li> </ul> <ul style="list-style-type: none"> <li>▪ <b>[3]</b> = Supports CAS Normal transfer. When a SIP REFER message is received, the device performs a Blind Transfer by executing a CAS Wink, dialing the Refer-to number to the switch, and then releasing the call.</li> <li>▪ <b>[4]</b> = Supports QSIG Single Step transfer (PRI/BRI):<br/> IP-to-Tel: When a SIP REFER message is received, the device performs a transfer by sending a Facility message to the PBX, initiating Single Step transfer. Once a success return result is received, the transfer is completed.<br/> Tel-to-IP: When a Facility message initiating Single Step transfer is received from the PBX, a SIP REFER message is sent to the IP side.</li> <li>▪ <b>[5]</b> = IP-to-Tel Blind Transfer mode supported for ISDN (PRI/BRI) protocols and implemented according to AT&amp;T Toll Free Transfer Connect Service (TR 50075) "Courtesy Transfer-Human-No Data". When the device receives a SIP REFER message, it performs a blind transfer by first dialing the DTMF digits (transfer prefix) defined by the parameter XferPrefixIP2Tel (configured to "*8" for AT&amp;T service), and then (after 500 msec) the device dials the DTMF of the number (referred) from the Refer-To header sip:URI userpart. If the hostpart of the Refer-To sip:URI contains the device's IP address, and if the Trunk Group selected according to the IP to Tel Routing table is the same Trunk Group as the original call, then the device performs the in-band DTMF transfer; otherwise, the device sends the INVITE according to regular transfer rules. After completing the in-band transfer, the device waits for the ISDN Disconnect message. If the Disconnect message is received during the first 5 seconds, the device sends a SIP NOTIFY with 200 OK message; otherwise, the device sends a NOTIFY with 4xx message.</li> </ul> <p><b>Note:</b> For configuring trunk transfer mode per trunk, use the parameter TrunkTransferMode_x.</p> |
| <b>[TrunkTransferMode_x]</b>                                | <p>Determines the trunk transfer mode per trunk (where x is the Trunk ID). For configuring trunk transfer mode for all trunks and for a description of the parameter options, refer to the parameter TrunkTransferMode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| [EnableQSIGTransferUpdate]                                                         | <p>and optional Privacy headers. This feature is supported for IP-to-Tel and Tel-to-IP calls.</p> <ul style="list-style-type: none"> <li>[0] Disable = (Default) Ignores QSIG Facility messages with CallTransferComplete or CallTransferUpdate invokes.</li> <li>[1] Enable</li> </ul> <p>For example, assume A and C are PBX call parties and B is the SIP IP phone:</p> <ol style="list-style-type: none"> <li>A calls B; B answers the call.</li> <li>A places B on hold and calls C; C answers the call.</li> <li>A performs a call transfer (the transfer is done internally by the PBX); B and C are connected to one another.</li> </ol> <p>In the above example, the PBX updates B that it is now talking with C. The PBX updates this by sending a QSIG Facility message with CallTransferComplete invoke APDU. The device interworks this message to a SIP UPDATE message containing a P-Asserted-Identity header with the number and name derived from the QSIG CallTransferComplete RedirectionNumber and RedirectionName.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>For IP-to-Tel calls, the RedirectionNumber and RedirectionName in the CallTransferComplete invoke is derived from the P-Asserted-Identity and Privacy headers in the received SIP INFO message.</li> <li>To include the P-Asserted-Identity header in outgoing SIP UPDATE messages, set the AssertedIDMode parameter to <b>Add P-Asserted-Identity</b>.</li> </ul> |
| EMS: CAS Detection Of Hook Flash<br>CLI: is-cas-sndhook-flsh<br>[CASSendHookFlash] | <p>Enables sending Wink signal toward CAS trunks.</p> <ul style="list-style-type: none"> <li>[0] = Disable (default)</li> <li>[1] = Enable</li> </ul> <p>If the device receives a mid-call SIP INFO message with flashhook event body (as shown below) and this parameter is set to 1, the device generates a wink signal toward the CAS trunk. The CAS wink signal is done by changing the A bit from 1 to 0, and then back to 1 for 450 msec.</p> <pre>INFO sip:4505656002@192.168.13.40:5060 SIP/2.0 Via: SIP/2.0/UDP 192.168.13.2:5060 From: &lt;sip:06@192.168.13.2:5060&gt; To: &lt;sip:4505656002@192.168.13.40:5060&gt;;tag=132878796-1040067870294 Call-ID: 0010-0016-D69A7DA8-1@192.168.13.2 CSeq:2 INFO Content-Type: application/broadsoft Content-Length: 17 event flashhook</pre> <p><b>Note:</b> This parameter is applicable only to T1 CAS protocols.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### 57.11.8 Answer and Disconnect Supervision Parameters

The answer and disconnect supervision parameters are described in the table below.

**Answer and Disconnect Parameters**

| Parameter                                                                                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Answer Supervision<br>EMS: Enable Voice Detection<br>CLI: answer-supervision<br><b>[EnableVoiceDetection]</b> | <p>Enables the sending of SIP 200 OK upon detection of speech, fax, or modem.</p> <ul style="list-style-type: none"> <li>▪ <b>[1]</b> Yes = The device sends a SIP 200 OK (in response to an INVITE message) when speech, fax, or modem is detected from the Tel side.</li> <li>▪ <b>[0]</b> No = (Default) The device sends a SIP 200 OK only after it completes dialing to the Tel side.</li> </ul> <p>Typically, this feature is used only when early media (enabled using the EnableEarlyMedia parameter) is used to establish the voice path before the call is answered.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ FXO interfaces: This feature is applicable only to one-stage dialing (FXO).</li> <li>▪ Digital interfaces: To activate this feature, set the EnableDSIPMDetectors parameter to 1.</li> <li>▪ Digital interfaces: This feature is applicable only when the protocol type is CAS.</li> </ul>                                                                                                                                                                     |
| Web/EMS: Max Call Duration (min)<br>CLI: mx-call-duration<br><b>[MaxCallDuration]</b>                              | <p>Defines the maximum duration (in minutes) of a call. If this duration is reached, the device terminates the call. This feature is useful for ensuring available resources for new calls, by ensuring calls are properly terminated.</p> <p>The valid range is 0 to 35,791. The default is 0 (i.e., no limitation).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| CLI: configure voip > sip advanced-settings > set mn-call-duration<br><b>[MinCallDuration]</b>                     | <p>Defines the minimum call duration (in seconds) for the Tel side. If an established call is terminated by the IP side before this duration expires, the device terminates the call with the IP side, but delays the termination toward the Tel side until this timeout expires.</p> <p>The valid value range is 0 to 10 seconds, where 0 (default) disables this feature.</p> <p>For example: assume the minimum call duration is set to 10 seconds and an IP phone hangs up a call established with a BRI phone after 2 seconds. As the call duration is less than the minimum call duration, the device does not disconnect the call on the Tel side. However, it sends a SIP 200 OK immediately upon receipt of the BYE to disconnect from the IP phone. The call is disconnected from the Tel side only when the call duration is greater than or equal to the minimum call duration.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ This parameter is applicable to IP-to-Tel and Tel-to-IP calls.</li> <li>▪ This parameter is applicable only to ISDN and CAS protocols.</li> </ul> |

## 57.11.9 Tone Parameters

This subsection describes the device's tone parameters.

### 57.11.9.1 Telephony Tone Parameters

The telephony tone parameters are described in the table below.

**Tone Parameters**

| Parameter                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLI: help-tone-4-ip2ip<br><b>[PlayHeldToneForIP2IP]</b> | <p>Enables playing a held tone to an IP-to-IP leg instead of placing it on hold.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) Disabled. The device interworks the re-INVITE with 'a=inactive' from one SIP leg to another SIP leg.</li> <li><b>[1]</b> = Enabled. The device plays a held tone to the IP if it receives a re-INVITE with 'a=inactive' in the SDP from the party initiating the call hold. The held tone must be configured</li> </ul> |

| Parameter                                                                                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Web: SIP Hold Behavior<br>CLI: sip-hold-behavior<br><b>[SIPHoldBehavior]</b>                                                         | <p>Enables the device to handle incoming re-INVITE messages with the "a=sendonly" attribute in the SDP, in the same way as if an "a=inactive" is received in the SDP. When enabled, the device plays a held tone to the Tel phone and responds with a SIP 200 OK containing the "a=recvonly" attribute in the SDP.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Web/EMS: Dial Tone Duration<br><b>[sec]</b><br>CLI: dt-duration<br><b>[TimeForDialTone]</b>                                          | <p>Defines the duration (in seconds) that the dial tone is played (for digital interfaces, to an ISDN terminal).</p> <p>For digital interfaces: This parameter is applicable for overlap dialing when ISDNInCallsBehavior is set to 65536. The dial tone is played if the ISDN Setup message doesn't include the called number.</p> <p>The valid range is 0 to 60. The default is 5.</p> <p>For analog interfaces: FXS interfaces play the dial tone after the phone is picked up (off-hook). FXO interfaces play the dial tone after the port is seized in response to ringing (from PBX/PSTN). The valid range is 0 to 60. The default time is 16.</p> <p>Notes for analog interfaces:</p> <ul style="list-style-type: none"> <li>▪ During play of dial tone, the device waits for DTMF digits.</li> <li>▪ This parameter is not applicable when Automatic Dialing is enabled.</li> </ul>                                                                          |
| Web/EMS: Stutter Tone Duration<br>CLI: sttr-tone-duration<br><b>[StutterToneDuration]</b>                                            | <p>Defines the duration (in msec) of the confirmation tone. A stutter tone is played (instead of a regular dial tone) when a Message Waiting Indication (MWI) is received. The stutter tone is composed of a confirmation tone (Tone Type #8), which is played for the defined duration (StutterToneDuration) followed by a stutter dial tone (Tone Type #15). Both these tones are defined in the CPT file.</p> <p>The range is 1,000 to 60,000. The default is 2,000 (i.e., 2 seconds).</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ This parameter is applicable only to FXS interfaces.</li> <li>▪ If you want to configure the duration of the confirmation tone to longer than 16 seconds, you must increase the value of the parameter TimeForDialTone accordingly.</li> <li>▪ The MWI tone takes precedence over the call forwarding reminder tone. For more information on MWI, see Message Waiting Indication on page 358.</li> </ul> |
| Web: FXO AutoDial Play BusyTone<br>EMS: Auto Dial Play Busy Tone<br>CLI: fxo-autodial-play-bsytn<br><b>[FXOAutoDialPlayBusyTone]</b> | <p>Determines whether the device plays a busy / reorder tone to the PSTN side if a Tel-to-IP call is rejected by a SIP error response (4xx, 5xx or 6xx). If a SIP error response is received, the device seizes the line (off-hook), and then plays a busy / reorder tone to the PSTN side (for the duration defined by the parameter TimeForReorderTone). After playing the tone, the line is released (on-hook).</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> = Disable (default)</li> <li>▪ <b>[1]</b> = Enable</li> </ul> <p><b>Note:</b> This parameter is applicable only to FXO interfaces.</p>                                                                                                                                                                                                                                                                                                                                                    |

| Parameter                                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <p>Web: Play Ringback Tone to Tel</p> <p>EMS: Play Ring Back Tone To Tel</p> <p>CLI: play-rbt2tel</p> <p><b>[PlayRBTone2Tel]</b></p> | <p>Determines the playing method of the ringback tone to the Tel (for analog interfaces) or Trunk (for digital interfaces) side. For digital interfaces: This parameter applies to all trunks that are not configured by the PlayRBTone2Trunk parameter (which defines ringback tone per Trunk).</p> <ul style="list-style-type: none"> <li><b>[0]</b> Don't Play = <ul style="list-style-type: none"> <li>✓ Analog Interfaces: Ringback tone is not played.</li> <li>✓ Digital Interfaces: The device configured for ISDN / CAS doesn't play a ringback tone. No PI is sent to the ISDN unless the ProgressIndicator2ISDN_x parameter is configured differently.</li> </ul> </li> <li><b>[1]</b> Play on Local = <ul style="list-style-type: none"> <li>✓ Analog Interfaces: Plays a ringback tone to the Tel side of the call when a SIP 180/183 response is received.</li> <li>✓ Digital Interfaces: The device configured for CAS plays a local ringback tone to the PSTN upon receipt of a SIP 180 Ringing response (with or without SDP). Note that the receipt of a 183 response does not cause the device configured for CAS to play a ringback tone (unless the SIP183Behaviour parameter is set to 1). The device configured for ISDN operates according to the LocalISDNRBSOURCE parameter: <ol style="list-style-type: none"> <li>If the device receives a 180 Ringing response (with or without SDP) and the LocalISDNRBSOURCE parameter is set to 1, it plays a ringback tone and sends an ISDN Alert with PI = 8 (unless the ProgressIndicator2ISDN_x parameter is configured differently).</li> <li>If the LocalISDNRBSOURCE parameter is set to 0, the device doesn't play a ringback tone and an Alert message without PI is sent to the ISDN. In this case, the PBX / PSTN plays the ringback tone to the originating terminal. Note that the receipt of a 183 response does not cause the device configured for ISDN to play a ringback tone; the device issues a Progress message (unless</li> </ol> </li> </ul> </li> </ul> |

|--------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                                                  | <p>SIP183Behaviour is set to 1). If the SIP183Behaviour parameter is set to 1, the 183 response is handled the same way as a 180 Ringing response.</p> <ul style="list-style-type: none"> <li>▪ <b>[2] Prefer IP = (Default):</b> <ul style="list-style-type: none"> <li>✓ Analog Interfaces: Plays a ringback tone to the Tel side only if a 180/183 response without SDP is received. If 180/183 with SDP message is received, the device cuts through the voice channel and doesn't play the ringback tone.</li> <li>✓ Digital Interfaces: Plays according to 'Early Media'. If a SIP 180 response is received and the voice channel is already open (due to a previous 183 early media response or due to an SDP in the current 180 response), the device configured for ISDN / CAS doesn't play the ringback tone; PI = 8 is sent in an ISDN Alert message (unless the ProgressIndicator2ISDN_x parameter is configured differently). If a 180 response is received, but the 'early media' voice channel is not opened, the device configured for CAS plays a ringback tone to the PSTN. The device configured for ISDN operates according to the LocalISDNRBSource parameter:               <ol style="list-style-type: none"> <li>1) If LocalISDNRBSource is set to 1, the device plays a ringback tone and sends an ISDN Alert with PI = 8 to the ISDN (unless the ProgressIndicator2ISDN_x parameter is configured differently).</li> <li>2) If LocalISDNRBSource is set to 0, the device doesn't play a ringback tone. No PI is sent in the ISDN Alert message (unless the ProgressIndicator2ISDN_x parameter is configured differently). In this case, the PBX / PSTN plays a ringback tone to the originating terminal.</li> </ol>               Note that the receipt of a 183 response results in an ISDN Progress message (unless SIP183Behaviour is set to 1). If SIP183Behaviour is set to 1 (183 is handled the same way as a 180 + SDP), the device sends an Alert message with PI = 8, without playing a ringback tone.             </li> </ul> </li> <li>▪ <b>[3] Play Local Until Remote Media Arrive =</b> Plays a ringback tone according to received media. The behaviour is similar to <b>[2]</b>. If a SIP 180 response is received and the voice channel is already open (due to a previous 183 early media response or due to an SDP in the current 180 response), the device plays a local ringback tone if there are no prior received RTP packets. The device stops playing the local ringback tone as soon as it starts receiving RTP packets. At this stage, if the device receives additional 18x responses, it does not resume playing the local ringback tone. Note that for ISDN trunks, this option is applicable only if the LocalISDNRBSource parameter is set to 1.</li> </ul> <p><b>Note:</b> This parameter is applicable to the Gateway and IP-to-IP applications.</p> |

|           | <p>(PI) is sent to the ISDN unless the ProgressIndicator2ISDN_x parameter is configured differently.</p> <ul style="list-style-type: none"> <li> <b>[1] Play on Local</b> = When the device is configured for CAS, it plays a local ringback tone to the PSTN upon receipt of a SIP 180 Ringing response (with or without SDP). Note that the receipt of a SIP 183 response does not cause the device configured for CAS to play a ringback tone (unless the SIP183Behaviour parameter is set to 1).         </li> </ul> <p>When the device is configured for ISDN, it operates according to the LocalISDNRBSource parameter, as follows:</p> <ul style="list-style-type: none"> <li>             ✓ If the device receives a SIP 180 Ringing response (with or without SDP) and the LocalISDNRBSource parameter is set to 1, it plays a ringback tone and sends an ISDN Alert with PI = 8 (unless the ProgressIndicator2ISDN_x parameter is configured differently).         </li> <li>             ✓ If the LocalISDNRBSource parameter is set to 0, the device doesn't play a ringback tone and an Alert message without PI is sent to the ISDN. In this case, the PBX / PSTN plays the ringback tone to the originating terminal. Note that the receipt of a 183 response does not cause the device to play a ringback tone; the device sends a Progress message (unless SIP183Behaviour is set to 1). If the SIP183Behaviour parameter is set to 1, the 183 response is handled the same way as a 180 Ringing response.         </li> <li> <b>[2] Prefer IP</b> = Plays according to 'Early Media'. If a SIP 180 response is received and the voice channel is already open (due to a previous 183 early media response or due to an SDP in the current 180 response), the device configured for ISDN / CAS doesn't play the ringback tone; PI = 8 is sent in an ISDN Alert message (unless the ProgressIndicator2ISDN_x parameter is configured differently).<br/>             If a 180 response is received, but the 'early media' voice channel is not opened, the device configured for CAS plays a ringback tone to the PSTN. The device configured for ISDN operates according to the LocalISDNRBSource parameter:             <ul style="list-style-type: none"> <li>                 ✓ If LocalISDNRBSource is set to 1, the device plays a ringback tone and sends an ISDN Alert with PI = 8 to the ISDN (unless the ProgressIndicator2ISDN_x parameter is configured differently).             </li> <li>                 ✓ If LocalISDNRBSource is set to 0, the device doesn't play a ringback tone. No PI is sent in the ISDN Alert message (unless the ProgressIndicator2ISDN_x parameter is configured differently). In this case, the PBX / PSTN plays a ringback tone to the originating terminal. Note that the receipt of a 183 response results in an ISDN Progress message (unless SIP183Behaviour is set to 1). If SIP183Behaviour is set to 1 (183 is handled the same way as a 180 with SDP), the device sends an Alert message with PI = 8 without playing a ringback tone.             </li> </ul> </li> <li> <b>[3] Play Local Until Remote Media Arrive</b> = Plays tone according to received media. The behaviour is similar to option <b>[2]</b>. If a SIP 180 response is received and the voice channel is already open (due to a previous 183 early media response or due to an SDP in the current 180 response), the device plays a local ringback tone if there are no prior received RTP         </li> </ul> |

### 57.11.10 Telephone Keypad Sequence Parameters

The telephony keypad sequence parameters are described in the table below.

**Telephone Keypad Sequence Parameters**

| Parameter                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web/EMS: Call Pickup Key<br>CLI: sip-definition advanced-settings > call-pickup-key<br><b>[KeyCallPickup]</b> | <p>Defines the keying sequence for performing a call pick-up. Call pick-up allows the FXS endpoint to answer another telephone's incoming call by pressing this user-defined sequence of digits. When the user dials these digits (e.g., #77), the incoming call from another phone is forwarded to the user's phone.</p> <p>The valid value is a string of up to 15 characters (0-9, #, and *). The default is undefined.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>Call pick-up is configured only for FXS endpoints pertaining to the same Trunk Group.</li> <li>This parameter is applicable only to FXS interfaces.</li> </ul> |
| <b>Prefix for External Line</b>                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>[Prefix2ExtLine]</b>                                                                                       | <p>Defines a string prefix (e.g., '9' dialed for an external line) that when dialed, the device plays a secondary dial tone (i.e., stutter tone) to the FXS line and then starts collecting the subsequently dialed digits from the FXS line.</p> <p>The valid range is a one-character string. The default is an empty string.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>You can enable the device to add this string as the prefix to the collected (and sent) digits, using the parameter AddPrefix2ExtLine.</li> <li>This parameter is applicable only to FXS interfaces.</li> </ul>                                            |
| CLI: prefix-2-ext-line<br><b>[AddPrefix2ExtLine]</b>                                                          | <p>Determines whether the prefix string for accessing an external line (defined by the parameter Prefix2ExtLine) is added to the dialed number as the prefix and together sent to the IP destination (Tel-to-IP calls).</p> <ul style="list-style-type: none"> <li><b>[0]</b> = Disable (default)</li> <li><b>[1]</b> = Enable</li> </ul> <p>For example, if this parameter is enabled and the prefix string for the external line is defined as "9" (using the parameter Prefix2ExtLine) and the FXS user wants to make a call to destination "123", the device collects</p>                                                                             |

| Web: IP Security<br>EMS: Secure Call From IP<br>CLI: ip-security<br><b>[SecureCallsFromIP]</b>          | <p>Determines the device's policy on accepting or blocking SIP calls (IP-to-Tel calls). This is useful in preventing unwanted SIP calls, SIP messages, and/or VoIP spam.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable = (Default) The device accepts all SIP calls.</li> <li>▪ <b>[1]</b> Secure Incoming calls = The device accepts SIP calls (i.e., calls from the IP side) only from IP addresses that are defined in the Outbound IP Routing Table or Proxy Set table, or IP addresses resolved from DNS servers from FQDN values defined in the Proxy Set table. All other incoming calls are rejected.</li> <li>▪ <b>[2]</b> Secure All calls = The device accepts SIP calls only from IP addresses (in dotted-decimal notation format) that are defined in the Outbound IP Routing Table table or Proxy Set table, and rejects all other incoming calls. In addition, if an FQDN is defined in the routing table or Proxy Set table, the call is allowed to be sent only if the resolved DNS IP address appears in one of these tables; otherwise, the call is rejected. Therefore, the difference between this option and option <b>[1]</b> is that this option is concerned only about numerical IP addresses that are defined in the tables.</li> </ul> <p><b>Note:</b> If this parameter is set to <b>[1]</b> or <b>[2]</b>, when using Proxies or Proxy Sets, it is unnecessary to configure the Proxy IP addresses in the routing table. The device allows SIP calls received from the Proxy IP addresses even if these addresses are not configured in the routing table.</p> |

| Web: Add CIC<br>CLI: add-cic<br><b>[AddCicAsPrefix]</b>            | <p>Determines whether to add the Carrier Identification Code (CIC) as a prefix to the destination phone number for IP-to-Tel calls. When this parameter is enabled, the 'cic' parameter in the incoming SIP INVITE can be used for IP-to-Tel routing decisions. It routes the call to the appropriate Trunk Group based on this parameter's value.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> No (default)</li> <li>▪ <b>[1]</b> Yes</li> </ul> <p>For digital interfaces: The SIP 'cic' parameter enables the transmission of the 'cic' parameter from the SIP network to the ISDN. The 'cic' parameter is a three- or four-digit code used in routing tables to identify the network that serves the remote user when a call is routed over many different networks. The 'cic' parameter is carried in the SIP INVITE and maps to the ISDN Transit Network Selection Information Element (TNS IE) in the outgoing ISDN Setup message (if the EnableCIC parameter is set to 1). The TNS IE identifies the requested transportation networks and allows different providers equal access support, based on customer choice.</p> <p>For example, as a result of receiving the below INVITE, the destination number after number manipulation is cic+167895550001:<br/>           INVITE sip:5550001;cic=+16789@172.18.202.60:5060;user=phone SIP/2.0</p> <p><b>Note:</b> After the cic prefix is added, the Inbound IP Routing Table can be used to route this call to a specific Trunk Group. The Destination Number IP to Tel Manipulation table must be used to remove this prefix before placing the call to the ISDN.</p> |
| <b>[FaxReroutingMode]</b>                                          | Enables re-routing of Tel-to-IP calls that are identified as fax calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                                                          | <p>If a CNG tone is detected on the Tel side of a Tel-to-IP call, the prefix string "FAX" is appended to the destination number before routing and manipulation. If you enter the string value, "FAX" as the destination number in the Outbound IP Routing table, the routing rule is used to route the call and the destination number manipulation mechanism is used to remove the "FAX" prefix, if required. Note that the "FAX" prefix string in routing and manipulation tables is case-sensitive.</p> <p>If the initial INVITE used to establish the voice call (not fax) was already sent, a CANCEL (if not connected yet) or a BYE (if already connected) is sent to release the voice call.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Rerouting without Delay</li> <li>▪ <b>[2]</b> Progress and Delay = Incoming ISDN calls are delayed until a CNG tone detection or timeout, set by the FaxReroutingDelay parameter. If the EnableComfortTone parameter is set to 1, a Q.931 Progress message with Protocol Discriminator set to 1 is sent to the PSTN and a comfort tone is played accordingly to the PSTN. When the timeout expires, the device sends an INVITE to a specific IP Group or to a fax server, according to the Outbound IP Routing table rules. This option is applicable only to ISDN.</li> <li>▪ <b>[3]</b> Connect and Delay = Incoming ISDN calls are delayed until a CNG tone detection or timeout, set by the FaxReroutingDelay parameter. A Q.931 Connect message is sent to the PSTN. If the EnableComfortTone parameter is set to 1, a comfort tone is played to the PSTN. When the timeout expires, the device sends an INVITE to a specific IP Group or to a fax server according to the Outbound IP Routing table rules. This option is applicable only to ISDN.</li> </ul> <p><b>Note:</b> This parameter has replaced the EnableFaxRerouting parameter. For backward compatibility, the EnableFaxRerouting parameter set to 1 is equivalent to the FaxReroutingMode parameter set to 1.</p> |
| <b>[FaxReroutingDelay]</b>                                               | <p>Defines the maximum time interval (in seconds) that the device waits for CNG detection before re-routing calls identified as fax calls to fax destinations (terminating fax machine).</p> <p>The valid value range is 1-10. The default is 5.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Web: ENUM Resolution<br>CLI: enum-service-domain<br><b>[EnumService]</b> | <p>Defines the ENUM service for translating telephone numbers to IP addresses or domain names (FQDN). For example, e164.arpa, e164.customer.net, or NREnum.net.</p> <p>The valid value is a string of up to 50 characters. The default is "e164.arpa".</p> <p><b>Note:</b> ENUM-based routing is configured in the Outbound IP Routing table using the "ENUM" string value as the destination address to denote this parameter's value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### 57.11.13 IP Connectivity Parameters

The IP connectivity parameters are described in the table below.

**IP Connectivity Parameters**

| Parameter                                                                                                                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Enable Alt Routing Tel to IP<br>EMS: Enable Alternative Routing<br>CLI: alt-routing-tel2ip<br><b>[AltRoutingTel2IPEnable]</b>                                                | Enables the Alternative Routing feature for Tel-to-IP calls. <ul style="list-style-type: none"> <li><b>[0]</b> Disable = (Default) Disables the Alternative Routing feature.</li> <li><b>[1]</b> Enable = Enables the Alternative Routing feature.</li> <li><b>[2]</b> Status Only = The Alternative Routing feature is disabled, but read-only information on the QoS of the destination IP addresses is provided.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Web: Alt Routing Tel to IP Mode<br>EMS: Alternative Routing Mode<br>CLI: alt-rte-tel2ip-mode<br><b>[AltRoutingTel2IPMode]</b>                                                     | Determines the IP Connectivity event(s) reason for triggering Alternative Routing. <ul style="list-style-type: none"> <li><b>[0]</b> None = Alternative routing is not used.</li> <li><b>[1]</b> Connectivity = Alternative routing is performed if SIP OPTIONS message to the initial destination fails (determined according to the AltRoutingTel2IPConnMethod parameter).</li> <li><b>[2]</b> QoS = Alternative routing is performed if poor QoS is detected.</li> <li><b>[3]</b> Both = (Default) Alternative routing is performed if either SIP OPTIONS to initial destination fails, poor QoS is detected, or the DNS host name is not resolved.</li> </ul> <b>Notes:</b> <ul style="list-style-type: none"> <li>QoS is quantified according to delay and packet loss calculated according to previous calls. QoS statistics are reset if no new data is received within two minutes.</li> <li>To receive quality information (displayed in the 'Quality Status' and 'Quality Info.' fields in 'Viewing IP Connectivity' on page 598) per destination, this parameter must be set to 2 or 3.</li> </ul> |
| Web: Alt Routing Tel to IP Connectivity Method<br>EMS: Alternative Routing Telephone to IP Connection Method<br>CLI: alt-rte-tel2ip-method<br><b>[AltRoutingTel2IPConnMethod]</b> | Determines the method used by the device for periodically querying the connectivity status of a destination IP address. <ul style="list-style-type: none"> <li><b>[0]</b> ICMP Ping = (Default) Internet Control Message Protocol (ICMP) ping messages.</li> <li><b>[1]</b> SIP OPTIONS = The remote destination is considered offline if the latest OPTIONS transaction timed out. Any response to an OPTIONS request, even if indicating an error, brings the connectivity status to online.</li> </ul> <b>Note:</b> ICMP Ping is currently not supported for the IP Connectivity feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Web: Alt Routing Tel to IP Keep Alive Time<br>EMS: Alternative Routing Keep Alive Time<br>CLI: alt-rte-tel2ip-keep-alive<br><b>[AltRoutingTel2IPKeepAliveTime]</b>                | Defines the time interval (in seconds) between SIP OPTIONS Keep-Alive messages used for the IP Connectivity application.<br>The valid range is 5 to 2,000,000. The default is 60.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Web: Max Allowed Delay for Alt Routing <b>[msec]</b><br>CLI: mx-all-dly-4-alt-rte<br><b>[IPConnQoSMaxAllowedDelay]</b> | Defines the transmission delay (in msec) at which the IP connection is considered a failure and the Alternative Routing mechanism is activated.<br><br>The range is 100 to 10,000. The default is 250. |

### 57.11.14 Alternative Routing Parameters

The alternative routing parameters are described in the table below.

**Alternative Routing Parameters**

| Parameter                                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web/EMS: Redundant Routing Mode<br>CLI: redundant-routing-m<br><b>[RedundantRoutingMode]</b>                            | Determines the type of redundant routing mechanism when a call can't be completed using the main route. <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable = No redundant routing is used. If the call can't be completed using the main route (using the active Proxy or the first matching rule in the Routing table), the call is disconnected.</li> <li>▪ <b>[1]</b> Routing Table = (Default) Internal routing table is used to locate a redundant route.</li> <li>▪ <b>[2]</b> Proxy = Proxy list is used to locate a redundant route.</li> </ul> <b>Note:</b> To implement the Redundant Routing Mode mechanism, you first need to configure the parameter AltRouteCauseTEL2IP (Reasons for Alternative Routing table). |
| <b>[EnableAltMapTel2IP]</b>                                                                                             | Enables different Tel-to-IP destination number manipulation rules per routing rule when several (up to three) Tel-to-IP routing rules are defined and if alternative routing using release causes is used. For example, if an INVITE message for a Tel-to-IP call is returned with a SIP 404 Not Found response, the call can be re-sent to a different destination number (as defined using the parameter NumberMapTel2IP). <ul style="list-style-type: none"> <li>▪ <b>[0]</b> = Disable (default)</li> <li>▪ <b>[1]</b> = Enable</li> </ul>                                                                                                                                                                                          |
| Web/EMS: Alternative Routing Tone Duration <b>[ms]</b><br>CLI: alt-rte-tone-duration<br><b>[AltRoutingToneDuration]</b> | Defines the duration (in milliseconds) for which the device plays a tone to the endpoint on each attempt for Tel-to-IP alternative routing. When the device finishes playing the tone, a new SIP INVITE message is sent to the new IP destination. The tone played is the call forward tone (Tone Type #25 in the CPT file).<br><br>The valid range is 0 to 20,000. The default is 0 (i.e., no tone is played).<br><br><b>Note:</b> This parameter is applicable only to Tel-to-IP alternative routing.                                                                                                                                                                                                                                 |
| <b>Reasons for Alternative Tel-to-IP Routing Table</b>                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Web: Reasons for Alternative Routing<br>EMS: Alt Route Cause Tel to IP<br>CLI: configure voip > gw                      | This table parameter configures SIP call failure reason values received from the IP side. If an IP call is released as a result of one of these reasons, the device attempts to locate an alternative IP route for the call in the Outbound IP Routing Table (if a Proxy is not used) or used as a redundant Proxy (you need to set the parameter                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter                                                                                                                                                                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <p>Web/EMS: Forward On Busy Trunk Destination<br/>         CLI: configure voip &gt; gw routing fwd-on-busy-trk-dest<br/> <b>[ForwardOnBusyTrunkDest]</b></p>                                                                      | <p>This table parameter configures the Forward On Busy Trunk Destination table. This table allows you to define an alternative IP destination if a trunk is busy for IP-to-Tel calls. The format of this parameter is as follows:</p> <p><b>[ForwardOnBusyTrunkDest]</b><br/>         FORMAT ForwardOnBusyTrunkDest_Index = ForwardOnBusyTrunkDest_TrunkGroupId, ForwardOnBusyTrunkDest_ForwardDestination;<br/> <b>[ForwardOnBusyTrunkDest]</b></p> <p>For example, the below configuration forwards IP-to-Tel calls to destination user "112" at host IP address 10.13.4.12, port 5060, using transport protocol TCP, if Trunk Group ID 2 is unavailable:<br/>         ForwardOnBusyTrunkDest 1 = 2,<br/>         112@10.13.4.12:5060;transport=tcp;</p> <p><b>Note:</b> For a detailed description of this table, see 'Alternative Routing to IP Destination upon Busy Trunk' on page <a href="#">340</a>.</p>                     |

### 57.11.15 Number Manipulation Parameters

The number manipulation parameters are described in the table below.

**Number Manipulation Parameters**

| Parameter                                                                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>[ManipulateIP2PSTNRefer To]</b>                                                                                                                                    | <p>Enables the manipulation of the called party (destination) number according to the SIP Refer-To header received by the device for TDM (PSTN) blind transfer. The number in the SIP Refer-To header is manipulated for all types of blind transfers to the PSTN (TBCT, ECT, RLT, QSIG, FXO, and CAS).</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>During the blind transfer, the device initiates a new call to the PSTN and the destination number of this call can be manipulated if this parameter is enabled. When enabled, the manipulation is done as follows:</p> <ol style="list-style-type: none"> <li>1 If you configure a value for the xferPrefix parameter, then this value (string) is added as a prefix to the number in the Refer-To header.</li> <li>2 This called party number is then manipulated using the IP-to-Tel Destination Phone Number Manipulation table. The source number of the transferred call is taken from the original call, according to its initial direction: <ul style="list-style-type: none"> <li>✓ Source number of the original call if it is a Tel-to-IP call</li> <li>✓ Destination number of the original call if it is an IP-to-Tel call</li> </ul> <p>This source number can also be used as the value for the 'Source Prefix' field in the IP-to-Tel Destination Phone Number Manipulation table. The local IP address is used as the value for the 'Source IP Address' field.</p> </li> </ol> <p><b>Note:</b> This manipulation does not affect IP-to-Trunk Group routing rules.</p> |
| Web: Use EndPoint Number As Calling Number Tel2IP<br>EMS: Use EP Number As Calling Number Tel to IP<br>CLI: epn-as-cpn-tel2ip<br><b>[UseEPNumAsCallingNum Tel2IP]</b> | <p>Enables the use of the B-channel number as the calling number (sent in the From field of the INVITE) instead of the number received in the Q.931 Setup message, for Tel-to-IP calls.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>For example, if the incoming calling party number in the Q.931 Setup message is "12345" and the B-channel number is 17, then the outgoing INVITE From header is set to "17" instead of "12345".</p> <p><b>Note:</b> When enabled, this feature is applied before routing and manipulation on the source number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Web: Use EndPoint Number As Calling Number IP2Tel<br>EMS: Use EP Number As Calling Number IP to Tel<br>CLI: epn-as-cpn-ip2tel<br><b>[UseEPNumAsCallingNum IP2Tel]</b> | <p>Enables the use of the B-channel number as the calling party number (sent in the Q.931 Setup message) instead of the number received in the From header of the INVITE, for IP-to-Tel calls.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>For example, if the incoming INVITE From header contains "12345" and the destined B-channel number is 17, then the outgoing calling party number in the Q.931 Setup message is set to "17" instead of "12345".</p> <p><b>Note:</b> When enabled, this feature is applied after routing and manipulation on the source number (i.e., just before sending to the Tel side).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter                                                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Web/EMS: Add Prefix to Redirect Number<br>CLI: add-pref-to-redir-nb<br><b>[Prefix2RedirectNumber]</b>                | Defines a string prefix that is added to the Redirect number received from the Tel side. This prefix is added to the Redirect Number in the SIP Diversion header.<br>The valid range is an 8-character string. The default is an empty string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 57.12 Least Cost Routing Parameters

The Least Cost Routing (LCR) parameters are described in the table below.

### LCR Parameters

| Parameter                                                                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Routing Rule Groups Table<br>CLI: configure voip > services least-cost-routing routing-rule-groups<br><b>[RoutingRuleGroups]</b>                         | This table parameter enables the LCR feature and configures the average call duration and default call cost. The default call cost determines whether routing rules that are not configured with a Cost Group are considered as a higher or lower cost route compared to other matching routing rules that are assigned Cost Groups.<br><b>[ RoutingRuleGroups ]</b><br>FORMAT RoutingRuleGroups_Index = RoutingRuleGroups_LCREnable, RoutingRuleGroups_LCRAverageCallLength, RoutingRuleGroups_LCRDefaultCost;<br><b>[ \RoutingRuleGroups ]</b><br><b>Note:</b> For a detailed description of this table, see 'Enabling LCR and Configuring Default LCR' on page 191. |
| Web: Cost Group Table<br>EMS: Cost Group Provisioning > Cost Group<br>CLI: configure voip > services least-cost-routing cost-group<br><b>[CostGroupTable]</b> | This table parameter configures the Cost Groups for LCR, where each Cost Group is configured with a name, fixed call connection charge, and a call rate (charge per minute).<br><b>[ CostGroupTable ]</b><br>FORMAT CostGroupTable_Index = CostGroupTable_CostGroupName, CostGroupTable_DefaultConnectionCost, CostGroupTable_DefaultMinuteCost;<br><b>[ \CostGroupTable ]</b><br>For example: CostGroupTable 2 = "Local Calls", 2, 1;<br><b>Note:</b> For a detailed description of this table, see 'Configuring Cost Groups' on page 193.                                                                                                                            |

| Parameter                                                                                                                                                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Cost Group > Time Band Table<br>EMS: Time Band Provisioning > Time Band<br>CLI: configure voip > services least-cost-routing cost-group-time-bands<br><b>[CostGroupTimebands]</b> | This table parameter configures time bands and associates them with Cost Groups.<br><b>[CostGroupTimebands]</b><br>FORMAT CostGroupTimebands_TimebandIndex = CostGroupTimebands_StartTime, CostGroupTimebands_EndTime, CostGroupTimebands_ConnectionCost, CostGroupTimebands_MinuteCost;<br><b>[CostGroupTimebands]</b><br><b>Note:</b> For a detailed description of this table, see 'Configuring Time Bands for Cost Groups' on page <a href="#">194</a> . |

## 57.13 LDAP Parameters

The Lightweight Directory Access Protocol (LDAP) parameters are described in the table below. For more information on routing based on LDAP, see 'Routing Based on LDAP Active Directory Queries' on page [179](#).

### LDAP Parameters

| Parameter                                                                                                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: LDAP Service<br>CLI: enable<br><b>[LDAPServiceEnable]</b>                                                      | Enables the LDAP feature. <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable</li> </ul> <b>Note:</b> For this parameter to take effect, a device reset is required.                                                                                                                                                                                                                                                                                                       |
| Web: LDAP Server IP<br>EMS: Server Ip<br><b>[LDAPServerIP]</b>                                                      | Defines the LDAP server's address as an IP address (in dotted-decimal notation, e.g., 192.10.1.255).<br>The default is 0.0.0.0.                                                                                                                                                                                                                                                                                                                                                                                       |
| Web: LDAP Server Port<br>EMS: Server Port<br>CLI: server-port<br><b>[LDAPServerPort]</b>                            | Defines the LDAP server's port number.<br>The valid value range is 0 to 65535. The default port number is 389.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Web: LDAP Server Domain Name<br>EMS: Server Domain Name<br>CLI: server-domain-name<br><b>[LDAPServerDomainName]</b> | Defines the host name (FQDN) of the LDAP server. The device tries to connect to the LDAP server according to the IP address list received in the DNS query. If there is no connection to the LDAP server or the connection to the LDAP server fails, the device tries to connect to the LDAP server with the next IP address in the DNS query list.<br><b>Note:</b> The 'LDAP Server IP' parameter takes precedence over this parameter. Thus, if you want to use an FQDN, keep the 'LDAP Server IP' parameter empty. |
| Web: LDAP Password<br>EMS: Password<br><b>[LDAPPassword]</b>                                                        | Defines the LDAP server's user password.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Web: LDAP Bind DN<br>EMS: Bind DN<br>CLI: password<br><b>[LDAPBindDN]</b>                                           | Defines the LDAP server's bind Distinguished Name (DN). This is used as the username during connection and binding to the server.<br>For example: LDAPBindDN = "CN=Search user,OU=Labs,DC=OCSR2,DC=local"<br><b>Note:</b> The DN is used to uniquely name an Active Directory object.                                                                                                                                                                                                                                 |
| Web: LDAP Search Dn                                                                                                 | Defines up to three search DN's for LDAP search queries. These are                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Parameter                                                                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EMS: Search DN<br>CLI: search-dns<br><b>[LDAPSearchDN]</b>                                                                                    | <p>the DN subtrees where the search is done. This parameter is mandatory for the search.</p> <p>The format of this parameter is as follows:</p> <p><b>[LdapSearchDNs ]</b><br/>           FORMAT LdapSearchDNs_Index = LdapSearchDNs_Base_Path;<br/> <b>[ \LdapSearchDNs ]</b></p> <p>For example:<br/>           LdapSearchDNs 0 = "CN=Search user,OU=NY,DC=OCSR2,DC=local";<br/>           LdapSearchDNs 1 = "CN=Search user,OU=SF,DC=OCSR2,DC=local";</p> <p>In this example, the DN path is defined by the LDAP names, cn (common name), ou (organizational unit) and dc (domain component).</p> <p><b>Note:</b> If you configure multiple DNS, you can specify whether the search is done sequentially or in parallel, using the LDAPSearchDNsinParallel parameter.</p> |
| CLI: search-dns-in-parallel<br><b>[LDAPSearchDNsinParallel]</b>                                                                               | <p>Defines the LDAP query DN search method in the AD database if multiple search DNS are configured, using the LDAPSearchDNs parameter.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Sequential = If the first DN search fails, the search is done on the next configured DN, and so on.</li> <li>▪ <b>[1]</b> Parallel (Default)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Web: LDAP Server Max Respond Time<br>EMS: Server Max Respond Time<br>CLI: server-max-respond-time<br><b>[LDAPServerMaxRespondTime]</b>        | <p>Defines the time (in seconds) that the device waits for LDAP server responses.</p> <p>The valid value range is 0 to 86400. | Parameter                                                                                               | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLI: ldap-private-nm-attr<br><b>[MSLDAPPrivateNumAttribute]</b>                                         | Defines the name of the attribute that represents the user's private number in the AD. If this value equals the value of the MSLDAPPrimaryKey or MSLDAPSecondaryKey parameter, then the device queries the AD for the destination number in this private attribute name; otherwise, this parameter is not used as a search key.<br>The default is "msRTCSIP-PrivateLine".                              |
| CLI: ldap-display-nm-attr<br><b>[MSLDAPDisplayNameAttribute]</b>                                        | Defines the attribute name that represents the Calling Name in the AD for LDAP queries based on calling number.<br>The valid value is a string of up to 49 characters. The default is "displayName".                                                                                                                                                                                                   |
| CLI: ldap-primary-key<br><b>[MSLDAPPrimaryKey]</b>                                                      | Defines the name of the attribute used as a query search key for the destination number in the AD. This is used instead of the "PBX" attribute name (configured by the MSLDAPPBXNumAttributeName parameter).<br>The default is not configured.                                                                                                                                                         |
| CLI: ldap-secondary-key<br><b>[MSLDAPSecondaryKey]</b>                                                  | Defines the name of the attribute used as the second query search key for the destination number in the AD, if the primary search key or PBX search is not found.                                                                                                                                                                                                                                      |
| LDAP Cache Service<br>CLI: cache<br><b>[LDAPCacheEnable]</b>                                            | Enables the LDAP cache service. <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <b>Notes:</b> <ul style="list-style-type: none"> <li>▪ For this parameter to take effect, a device reset is required.</li> <li>▪ For more information on LDAP caching, see 'Configuring the Device's LDAP Cache' on page <a href="#">180</a>.</li> </ul> |
| LDAP Cache Entry Timeout<br>CLI: entry-timeout<br><b>[LDAPCacheEntryTimeout]</b>                        | Defines the duration (in minutes) that an entry in the LDAP cache is valid. If the timeout expires, the cached entry is only used if there is no connectivity with the LDAP server.<br>The default is 1200.                                                                                                                                                                                            |
| LDAP Cache Entry Removal Timeout<br>CLI: entry-removal-timeout<br><b>[LDAPCacheEntryRemovalTimeout]</b> | Defines the duration (in hours) after which the LDAP entry is removed from the cache.<br>The default is 0.                                                                                                                                                                                                                                                                                             |

## 57.14 SBC and CRP Parameters

The SBC and CRP parameters are described in the table below.

**SBC and CRP Parameters**

| Parameter                                                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| WAN Interface Name<br><b>[WanInterfaceName]</b>                                             | <p>Defines the WAN interface for the VoIP interface. The available interface options depends on the hardware configuration (e.g., Ethernet or SHDSL) and/or whether VLANs are defined for the WAN interface.</p> <p>The value must be enclosed in single quotation marks ('...'), for example, WanInterfaceName = 'GigabitEthernet 0/0'.</p> <p>This WAN interface can be assigned to SIP signaling and/or media interfaces, in the SIP Interface table, where it is represented as "WAN" (see Configuring SIP Interface Table on page 201). If VLANs are configured, for example, for the Ethernet WAN interface (see Data Settings on page 525), then you can select the WAN VLAN on which you want to run these SIP signaling and/or media interfaces. Therefore, for each outgoing SIP packet, the device sends it on the defined outgoing WAN interface; for each incoming SIP packet, the device identifies the packet according to the WAN interface from where it is received.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ For this parameter to take effect, a device reset is required.</li> <li>▪ This parameter is applicable only if the data-routing functionality is supported (i.e., relevant Software License Key is installed on the device).</li> </ul> |

|---------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Calls<br>CLI: unclassified-calls<br><b>[AllowUnclassifiedCalls]</b>                   | <p>classification process fails) to a Source IP Group are rejected or processed.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Reject = Call is rejected if classification fails.</li> <li>▪ <b>[1]</b> Allow = (Default) If classification fails, the incoming packet is assigned to a source IP Group (and subsequently processed) as follows: <ul style="list-style-type: none"> <li>✓ The source SRD is determined according to the SIP Interface to where the SIP-initiating dialog request is sent. The source IP Group is set to the default IP Group associated with this SRD.</li> <li>✓ If the source SRD is ID 0, then source IP Group ID 0 is chosen. In case of any other SRD, then the first IP Group associated with this SRD is chosen as the source IP Group or the call. If no IP Group is associated with this SRD, the call is rejected.</li> </ul> </li> </ul>                                                                               |
| Web: SBC No Answer Timeout<br>CLI: sbc-no-arelt-timeout<br><b>[SBCAlertTimeout]</b>   | <p>Defines the timeout (in seconds) for SBC outgoing (outbound IP routing) SIP INVITE messages. If the called IP party does not answer the call within this user-defined interval, the device disconnects the session. The device starts the timeout count upon receipt of a SIP 180 Ringing response from the called party. If no other SIP response (for example, 200 OK) is received thereafter within this timeout, the call is released.</p> <p>The valid range is 0 to 3600 seconds. the default is 600.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Web: SBC Max Forwards Limit<br>CLI: sbc-max-fwd-limit<br><b>[SBCMaxForwardsLimit]</b> | <p>Defines the Max-Forwards SIP header value. The Max-Forwards header is used to limit the number of servers (such as proxies) that can forward the SIP request. The Max-Forwards value indicates the remaining number of times this request message is allowed to be forwarded. This count is decremented by each server that forwards the request.</p> <p>This parameter affects the Max-Forwards header in the received message as follows:</p> <ul style="list-style-type: none"> <li>▪ If the received header's original value is 0, the message is not passed on and is rejected.</li> <li>▪ If the received header's original value is less than this parameter's value, the header's value is decremented before being sent on.</li> <li>▪ If the received header's original value is greater than the parameter's value, the header's value is replaced by the user-defined parameter's value.</li> </ul> <p>The valid value range is 1-70. The default is 10.</p> |
| Web: SBC Session-Expires<br><b>[SBCSessionExpires]</b>                                | <p>Defines the SBC session refresh timer (in seconds) in the Session-Expires header of outgoing INVITE messages.</p> <p>The valid value range is 90 (according to RFC 4028) to 86400. | CLI: sbc-xfer-prefix<br><b>[SBCXferPrefix]</b> | <p>When the SBCReferBehavior is set to 1, the device, while interworking the SIP REFER message, adds the prefix "T~&amp;R-" to the user part of the URI in the Refer-To header. After this, the device can receive an INVITE with such a prefix (the INVITE is sent by the UA that receives the REFER message or 302 response). If the device receives an INVITE with such a prefix, it replaces the prefix with the value defined for the SBCXferPrefix parameter.</p> <p>The default is empty ("").</p> <p><b>Note:</b> This feature is also applicable to 3xx redirect responses. The device adds the prefix "T~&amp;R-" to the URI user part in the Contact header if the SBC3xxBehavior parameter is set to 1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CLI: sbc-3xx-bhvt<br><b>[SBC3xxBehavior]</b>   | <p>Determines the device's handling of SIP 3xx responses. When enabled, the device handles SIP redirections between different subnets (e.g., between LAN and WAN sides). This is required where the new address provided by the redirector (Redirect sever) may not be reachable by the far-end user (FEU) located in another subnet. For example, a far-end user (FEU) in the WAN sends a SIP request via the device to a Redirect server in the LAN, and the Redirect server replies with a SIP 3xx response to a PBX in the LAN in the Contact header. If the device sends this response as is (i.e., with the original Contact header), the FEU is unable to reach the new destination.</p> <ul style="list-style-type: none"> <li>▪ <b>[0] Transparent = (Default)</b> The device forwards the received SIP 3xx response as is, without changing the Contact header (i.e., transparent handling).</li> <li>▪ <b>[1] DB URL =</b> The device changes the Contact header so that the re-route request is sent through the the device. The device changes the URI in the Contact header of the received SIP 3xx response to its own URI and adds a special user prefix ("T~&amp;R_"), which is then sent to the FEU. The FEU then sends a new INVITE to the device, which the device then sends to the correct destination.</li> <li>▪ <b>[2] Handle Locally =</b> The device handles SIP 3xx responses on behalf of the dialog-initiating UA and retries the request (e.g., INVITE) using one or more alternative URIs included in the 3xx response. The device sends the new request to the alternative destination according to the IP-to-IP Routing table (the 'Call Trigger' field must be set to <b>3xx</b>).</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>▪ When this parameter is changed from 1 to 0, new 3xx Contact headers remain unchanged. However, requests with the special prefix continue using the device's database to locate the new destination.</li> <li>▪ Only one database entry is supported for the same host, port, and transport combination. For example, the following URLs cannot be distinguished by the device:               <ul style="list-style-type: none"> <li>✓ sip:10.10.10.10:5060;transport=tcp;param=a</li> <li>✓ sip:10.10.10.10:5060;transport=tcp;param=b</li> </ul> </li> <li>▪ The database entry expires two hours after the last use.</li> <li>▪ The maximum number of destinations (i.e., database entries) is 50.</li> <li>▪ This parameter can also be configured as an IP Profile.</li> </ul> |

| Parameter                                                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Web: Authentication Quality of Protection<br>CLI: auth-qop<br><b>[AuthQOP]</b>                | <p>Defines the authentication and integrity level of quality of protection (QoP) for digest authentication offered to the client. When the device challenges a SIP request (e.g., INVITE), it sends a SIP 401 response with the Proxy-Authenticate header or WWW-Authenticate header containing the 'qop' parameter. The QoP offered in the 401 response can be 'auth', 'auth-int', both 'auth' and 'auth-int', or the 'qop' parameter can be omitted from the 401 response. In response to the 401, the client needs to send the device another INVITE with the MD5 hash of the INVITE message and indicate the selected auth type.</p> <ul style="list-style-type: none"> <li><b>[0]</b> 0 = The device sends 'qop=auth' in the SIP response, requesting authentication (i.e., validates user by checking user name and password). This option does not authenticate the message body (i.e., SDP).</li> <li><b>[1]</b> 1 = The device sends 'qop=auth-int' in the SIP response, indicating required authentication and authentication with integrity (e.g., checksum). This option restricts the client to authenticating the entire SIP message, including the body, if present.</li> <li><b>[2]</b> 2 = (Default) The device sends 'qop=auth, auth-int' in the SIP response, indicating either authentication or integrity. This enables the client to choose 'auth' or 'auth-int'. If the client chooses 'auth-int', then the body is included in the authentication. If the client chooses 'auth', then the body is not authenticated.</li> <li><b>[3]</b> 3 = No 'qop' parameter is offered by the device in the SIP 401 challenge message.</li> </ul> |

| Web: SBC Alternative Routing Reasons<br>EMS: Alternative Routing Reasons<br>CLI: configure voip > sbc routing sbc-alternative-routing-reasons<br><b>[SBCAlternativeRoutingReasons]</b> | This table parameter configures the SBC Alternative Routing Reasons table. This table is used for alternative IP-to-IP routing. If 4xx, 5xx, or 6xx SIP responses are received as a result of outgoing SIP dialog-initiating methods (e.g., INVITE, OPTIONS, and SUBSCRIBE messages), the device re-sends the messages to an alternative route if the response is defined in this table and if there are alternative routes configured in the IP-to-IP Routing table.<br>The format of this parameter is as follows:<br><b>[ SBCAlternativeRoutingReasons ]</b><br>FORMAT SBCAlternativeRoutingReasons_Index = SBCAlternativeRoutingReasons_ReleaseCause;<br><b>[ \SBCAlternativeRoutingReasons ]</b><br>For example:<br>SBCAlternativeRoutingReasons 0 = 403;<br>SBCAlternativeRoutingReasons 1 = 404;<br><b>Note:</b> For a detailed description of this table, see 'Configuring                                                                                          |

| Parameter                                                                                                                                                                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 57.15 Standalone Survivability Parameters

The Stand-alone Survivability (SAS) parameters are described in the table below.

### SAS Parameters

| Parameter                                                                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: Enable SAS<br>EMS: Enable<br>CLI: enable-sas<br><b>[EnableSAS]</b>                                              | <p>Enables the Stand-Alone Survivability (SAS) feature.</p> <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> <p>When enabled, the device receives the registration requests from different SIP entities in the local network and then forwards them to the defined proxy. If the connection to the proxy fails ('Emergency Mode'), the device serves as a proxy by allowing calls internal to the local network or outgoing to PSTN.</p> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p> |
| Web: SAS Local SIP UDP Port<br>EMS: Local SIP UDP<br>CLI: sas-local-sip-udp-port<br><b>[SASLocalSIPUDPPort]</b>      | <p>Defines the local UDP port for sending and receiving SIP messages for SAS. The SIP entities in the local network need to send the registration requests to this port. When forwarding the requests to the proxy ('Normal Mode'), this port serves as the source port.</p> <p>The valid range is 1 to 65,534. The default is 5080.</p>                                                                                                                                                                                                                                                 |
| Web: SAS Default Gateway IP<br>EMS: Default Gateway IP<br>CLI: sas-default-gw-ip<br><b>[SASDefaultGatewayIP]</b>     | <p>Defines the Default Gateway used in SAS 'Emergency Mode'. When an incoming SIP INVITE is received and the destination Address-Of-Record is not included in the SAS database, the request is immediately sent to this default gateway.</p> <p>The address can be configured as an IP address (dotted-decimal notation) or as a domain name (up to 49 characters). You can also configure the IP address with a destination port, e.g., "10.1.2.3:5060". The default is a null string, i.e., the local IP address of the gateway.</p>                                                   |
| Web: SAS Registration Time<br>EMS: Registration Time<br>CLI: sas-registration-time<br><b>[SASRegistrationTime]</b>   | <p>Defines the value of the SIP Expires header that is sent in a 200 OK response to an incoming REGISTER message when in SAS 'Emergency Mode'.</p> <p>The valid range is 0 (Analog) or 10 (Digital) to 2,000,000. The default is 20.</p>                                                                                                                                                                                                                                                                                                                                                 |

|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Web: SAS Connection Reuse<br>CLI: sas-connection-reuse<br><b>[SASConnectionReuse]</b>                                | <p>Enables the re-use of the same TCP connection for sessions with the same user in the SAS application.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Disable</li> <li><b>[1]</b> Enable (default)</li> </ul> <p>The device can use the same TCP connection for multiple SIP requests / responses for a specific SIP UA. The benefits of this feature include less CPU and memory usage because fewer TCP connections are open and reduced network congestion. For example, assume the following:</p> <ul style="list-style-type: none"> <li>User A sends a REGISTER message to SAS with transport=TCP.</li> <li>User B sends an INVITE message to A using SAS.</li> </ul> <p>In this scenario, the SAS application forwards the INVITE request using the TCP connection that User A initially opened with the REGISTER message.</p> |
| Web/EMS: Enable Record-Route<br>CLI: record-route<br><b>[SASEnableRecordRoute]</b>                                   | <p>Determines whether the device's SAS application adds the SIP Record-Route header to SIP requests. This ensures that SIP messages traverse the device's SAS agent by including the SAS IP address in the Record-Route header.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Disable (default)</li> <li><b>[1]</b> Enable</li> </ul> <p>The Record-Route header is inserted in a request by a SAS proxy to force future requests in the dialog session to be routed through the SAS agent. Each traversed proxy in the path can insert this header, causing all future dialogs in the session to pass through it as well.</p> <p>When this feature is enabled, the SIP Record-Route header includes the URI "lr" parameter, indicating loose routing, for example:</p> <p>Record-Route: &lt;sip:server10.biloxi.com;lr&gt;</p>       |
| Web: SAS Proxy Set<br>EMS: Proxy Set<br>CLI: sas-proxy-set<br><b>[SASProxySet]</b>                                   | <p>Defines the Proxy Set (index number) used in SAS Normal mode to forward REGISTER and INVITE requests from users that are served by the SAS application.</p> <p>The valid range is 0 to 5. The default is 0 (i.e., default Proxy Set).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Web: Redundant SAS Proxy Set<br>EMS: Redundant Proxy Set<br>CLI: rdcy-sas-proxy-set<br><b>[RedundantSASProxySet]</b> | <p>Defines the Proxy Set (index number) used in SAS Emergency mode for fallback when the user is not found in the Registered Users database. Each time a new SIP request arrives, the SAS application checks whether the user is listed in the registration database. If the user is located in the database, the request is sent to the user. If the user is not found, the request is forwarded to the next redundant SAS defined in the Redundant SAS Proxy Set. If that SAS Proxy IP appears in the Via header of the request, it is not forwarded (thereby, preventing loops in the request's course). If no such redundant SAS exists, the SAS sends the request to its default gateway (configured by the parameter SASDefaultGatewayIP).</p> <p>The valid range is -1 to 5. The default is -1 (i.e., no redundant Proxy Set).</p>     |
| Web/EMS: SAS Block Unregistered Users<br>CLI: sas-block-unreg-usrs<br><b>[SASBlockUnRegUsers]</b>                    | <p>Determines whether the device rejects SIP INVITE requests received from unregistered SAS users. This applies to SAS Normal and Emergency modes.</p> <ul style="list-style-type: none"> <li><b>[0]</b> Un-Block = (Default) Allow INVITE from unregistered SAS users.</li> <li><b>[1]</b> Block = Reject dialog-establishment requests from un-registered SAS users.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Parameter                                                                                                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [SASEmergencyNumbers]                                                                                                                                          | forwards the INVITE to the default gateway (configured by the parameter SASDefaultGatewayIP), i.e., the device itself, which sends the call directly to the PSTN. This is important for routing emergency numbers such as 911 (in North America) directly to the PSTN. This is applicable to SAS operating in Normal and Emergency modes.<br><br>Up to four emergency numbers can be defined, where each number can be up to four digits.                                                                                                                                                                                                                                                                                                                                                                |
| CLI: sas-emerg-prefix<br>[SASEmergencyPrefix]                                                                                                                  | Defines a prefix that is added to the Request-URI user part of the INVITE message that is sent by the device's SAS agent when in Emergency mode to the default gateway or to any other destination (using the IP-to-IP Routing table). This parameter is required to differentiate between normal SAS calls routed to the default gateway and emergency SAS calls. Therefore, this allows you to define different manipulation rules for normal and emergency calls.<br><br>This valid value is a character string. The default is an empty "" string.                                                                                                                                                                                                                                                   |
| Web: SAS Entering Emergency Mode<br>CLI: sas-enter-emg-mode<br>[SASEnteringEmergencyMode]                                                                      | Determines for which sent SIP message types the device enters SAS Emergency mode if no response is received for them from the proxy server. <ul style="list-style-type: none"> <li>[0] = (Default) SAS enters Emergency mode only if no response is received from sent SIP OPTIONS messages.</li> <li>[1] = SAS enters Emergency mode if no response is received from sent SIP OPTIONS, INVITE, or REGISTER messages.</li> </ul> <b>Note:</b> If the keep-alive mechanism is disabled for the Proxy Set (in the Proxy Set table) and this parameter is set to [1], SAS enters Emergency mode only if no response is received from sent INVITE or REGISTER messages.                                                                                                                                      |

| EMS: Disable Fast Adaptation<br>CLI: AGC-disable-fast-adaptation<br><b>[AGCDisableFastAdaptation]</b> | Enables the AGC Fast Adaptation mode. <ul style="list-style-type: none"> <li>▪ <b>[0]</b> = Disable (default)</li> <li>▪ <b>[1]</b> = Enable</li> </ul> <b>Note:</b> For this parameter to take effect, a device reset is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Energy Detector Parameters                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Parameter                                                                                                             | Description                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable Energy Detector<br>CLI: energy-detector-enable<br><b>[EnableEnergyDetector]</b>                                | Enables the Energy Detector feature. This feature generates events (notifications) when the signal received from the PSTN is higher or lower than a user-defined threshold (defined by the EnergyDetectorThreshold parameter). <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul> |
| Energy Detector Quality Factor<br>CLI: energy-detector-sensitivity<br><b>[EnergyDetectorQualityFactor]</b>            | Defines the Energy Detector's sensitivity level.<br>The valid range is 0 to 10, where 0 is the lowest sensitivity and 10 the highest sensitivity. The default is 4.                                                                                                                                                                          |
| Energy Detector Threshold<br>CLI: energy-detector-threshold<br><b>[EnergyDetectorThreshold]</b>                       | Defines the Energy Detector's threshold. A signal below or above this threshold invokes an 'Above' or 'Below' event.<br>The threshold is calculated as follows:<br>Actual Threshold = -44 dBm + (EnergyDetectorThreshold * 6)<br>The valid value range is 0 to 7. The default is 3 (i.e., -26 dBm).                                          |
| Pattern Detection Parameters                                                                                          |                                                                                                                                                                                                                                                                                                                                              |
| <b>Note:</b> For an overview on the pattern detector feature for TDM tunneling, see DSP Pattern Detector on page 282. |                                                                                                                                                                                                                                                                                                                                              |
| Web: Enable Pattern Detector<br><b>[EnablePatternDetector]</b>                                                        | Enables the Pattern Detector (PD) feature. <ul style="list-style-type: none"> <li>▪ <b>[0]</b> Disable (default)</li> <li>▪ <b>[1]</b> Enable</li> </ul>                                                                                                                                                                                     |
| <b>[PDPattern]</b>                                                                                                    | Defines the patterns that can be detected by the Pattern Detector. The valid range is 0 to 0xFF.<br><b>Note:</b> For this parameter to take effect, a device reset is required.                                                                                                                                                              |
| <b>[PDThreshold]</b>                                                                                                  | Defines the number of consecutive patterns to trigger the pattern detection event.<br>The valid range is 0 to 31. The default is 5.<br><b>Note:</b> For this parameter to take effect, a device reset is required.                                                                                                                           |

## 57.17 Auxiliary and Configuration File Name Parameters

The configuration files (i.e., auxiliary files) can be loaded to the device using the Web interface. For loading these files using the *ini* file, you need to configure these files in the *ini* file and configured whether they must be stored in the non-volatile memory. The table below lists the *ini* file parameters associated with these auxiliary files. For more information on the auxiliary files, see 'Loading Auxiliary Files' on page 535.

**Auxiliary and Configuration File Parameters**

| Parameter                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General Parameters</b>                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>[SetDefaultOnIniFileProcess]</b>                                          | <p>Determines if all the device's parameters are set to their defaults before processing the updated <i>ini</i> file.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = Disable - parameters not included in the downloaded <i>ini</i> file are not returned to default settings (i.e., retain their current settings).</li> <li><b>[1]</b> = Enable (default).</li> </ul> <p><b>Note:</b> This parameter is applicable only for automatic HTTP update or Web <i>ini</i> file upload (not applicable if the <i>ini</i> file is loaded using BootP).</p> |
| <b>[SaveConfiguration]</b>                                                   | <p>Determines if the device's configuration (parameters and files) is saved to flash (non-volatile memory).</p> <ul style="list-style-type: none"> <li><b>[0]</b> = Configuration isn't saved to flash memory.</li> <li><b>[1]</b> = (Default) Configuration is saved to flash memory.</li> </ul>                                                                                                                                                                                                                                                             |
| <b>Auxiliary and Configuration File Name Parameters</b>                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Web/EMS: Call Progress Tones File<br><b>[CallProgressTonesFileName]</b>      | <p>Defines the name of the file containing the Call Progress Tones definitions. For more information on how to create and load this file, refer to <i>DConvert Utility User's Guide</i>.</p> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                                                               |
| Web: CAS File<br>EMS: Trunk Cas Table Index<br><b>[CASFileName_x]</b>        | <p>Defines the CAS file name (e.g., 'E_M_WinkTable.dat'), which defines the CAS protocol (where x denotes the CAS file ID 0 to 7). It is possible to define up to eight different CAS files by repeating this parameter. Each CAS file can be associated with one or more of the device's trunks, using the parameter CASTableIndex or it can be associated per B-channel using the parameter CASChannelIndex.</p> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                         |
| Web: Dial Plan<br>EMS: Dial Plan Name<br><b>[CasTrunkDialPlanName_x]</b>     | <p>Defines the Dial Plan name (up to 11-character strings) per trunk.</p> <p><b>Note:</b> The x in the <i>ini</i> file parameter name denotes the trunk number, where 0 is Trunk 1.</p>                                                                                                                                                                                                                                                                                                                                                                       |
| Web: Dial Plan File<br>EMS: Dial Plan File Name<br><b>[DialPlanFileName]</b> | <p>Defines the name (and path) of the Dial Plan file. This file should be created using AudioCodes DConvert utility (refer to <i>DConvert Utility User's Guide</i>).</p>                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>[UserInfoFileName]</b>                                                    | <p>Defines the name (and path) of the file containing the User Information data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 57.18 Automatic Update Parameters

The automatic update of software and configuration files parameters are described in the table below.

**Automatic Update of Software and Configuration Files Parameters**

| Parameter                                                                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General Automatic Update Parameters</b>                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>[AutoUpdateCmpFile]</b>                                                                           | <p>Enables the Automatic Update mechanism for the cmp file.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) The Automatic Update mechanism doesn't apply to the cmp file.</li> <li><b>[1]</b> = The Automatic Update mechanism includes the cmp file.</li> </ul> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                        |
| <b>[AutoUpdateFrequency]</b>                                                                         | <p>Defines the number of minutes that the device waits between automatic updates. The default is 0 (i.e., the update at fixed intervals mechanism is disabled).</p> <p><b>Note:</b> For this parameter to take effect, a device reset is required.</p>                                                                                                                                                                                                                                                                                                                                                       |
| <b>[AutoUpdatePredefined Time]</b>                                                                   | <p>Defines schedules (time of day) for automatic updates. The format of this parameter is: 'HH:MM', where <i>HH</i> denotes the hour and <i>MM</i> the minutes, for example, 20:18.</p> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>For this parameter to take effect, a device reset is required.</li> <li>The actual update time is randomized by five minutes to reduce the load on the Web servers.</li> </ul>                                                                                                                                                                           |
| EMS: AUPD Verify Certificates<br>CLI: system/tls/aupd-verify-cert<br><b>[AUPDVerifyCertificates]</b> | <p>Determines whether the Automatic Update mechanism verifies server certificates when using HTTPS.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = Disable (default)</li> <li><b>[1]</b> = Enable</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>[AUPDCheckIfIniChanged]</b>                                                                       | <p>Determines whether the Automatic Update mechanism performs CRC checking to determine if the <i>ini</i> file has changed prior to processing.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) Do not check CRC. The <i>ini</i> file is loaded whenever the server provides it.</li> <li><b>[1]</b> = Check CRC for the entire file. Any change, including line order, causes the <i>ini</i> file to be re-processed.</li> <li><b>[2]</b> = Check CRC for individual lines. Use this option when the HTTP server scrambles the order of lines in the provided <i>ini</i> file.</li> </ul> |
| CLI: auto-update-use-zero-conf-certs<br><b>[AupdUseZeroConfCertificates]</b>                         | <p>Enables the Automatic Update feature to use the same client-server certificate as used for the Zero Configuration feature, instead of the "regular" certificate used for Automatic Update.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) The device uses the "regular" certificate for Automatic Update.</li> <li><b>[1]</b> = The device uses the Zero Configuration certificate for the Automatic Update feature.</li> </ul>                                                                                                                                                        |
| <b>[ResetNow]</b>                                                                                    | <p>Invokes an immediate device reset. This option can be used to activate offline (i.e., not on-the-fly) parameters that are loaded using the parameter IniFileUrl.</p> <ul style="list-style-type: none"> <li><b>[0]</b> = (Default) The immediate restart mechanism is disabled.</li> <li><b>[1]</b> = The device immediately resets after an <i>ini</i> file with this parameter set to 1 is loaded.</li> </ul>                                                                                                                                                                                           |

|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLI: tls-cert<br>[TLSCertFileUrl]        | Defines the name of the TLS certificate file and the URL from where it can be downloaded.<br><b>Note:</b> For this parameter to take effect, a device reset is required.                                                                                        |
| CLI: tls-private-key<br>[TLSPkeyFileUrl] | Defines the URL for downloading a TLS private key file using the Automatic Update facility.                                                                                                                                                                     |
| [UserInfoFileURL]                        | Defines the name of the User Information file and the path to the server (IP address or FQDN) on which it is located.<br>For example: http://server_name/file, https://server_name/file<br><b>Note:</b> The maximum length of the URL address is 99 characters. |

## 58 DSP Templates

The device supports the following DSP firmware capabilities.

### Notes:

- Up to 200 users (SAS, SBC, and IP-to-IP) can be registered in the device's database.
- Installation and use of voice coders is subject to obtaining the appropriate license and royalty payments.
- For additional DSP templates, contact your AudioCodes representative.

### Channel Capacity and Capabilities

| Telephony Interface Assembly  | DSP Channels on Physical Interface | SBC Enhancements | Advanced DSP Capabilities |        |      |         |         |                      |                         | SBC Sessions |
|-------------------------------|------------------------------------|------------------|---------------------------|--------|------|---------|---------|----------------------|-------------------------|--------------|
|                               |                                    |                  | IPM Detectors             | AMR WB | SILK | SILK WB | V.150.1 | Transcoding Sessions | Conference Participants |              |
| 2 x E1/T1                     | 60 / 48                            | -                | -                         | -      | -    | -       | -       | 0 / 6                | -                       | 0 / 12       |

**Notes:**

- For availability of the telephony assemblies listed in the table above, please contact your AudioCodes sales representative.
- All hardware assemblies also support the following DSP channel capabilities: IBS, echo cancellation (EC), CID (caller ID), silence compression (SC), T.38, G.711, G.726, G.729, G.723.1, G.722, AMR, RTCP XR reporting, SRTP.
- SBC enhancements include the network Acoustic Echo Suppressor.
- IPM Detectors include Automatic Gain Control (AGC) and Answer Detector (AD).
- V.150.1 is supported only for the US Department of Defense (DoD).
- Transcoding Sessions are part of the total SBC Sessions.
- The Conference Participants column lists the number of participants in one or more conference (bridge), where each conference may include three or more participants. Conferences are supported on all above configurations. Please contact AudioCodes for the maximum number of participants per configuration.

## 59 Technical Specifications

The device's technical specifications are listed in the table below.

### Notes:

- All specifications in this document are subject to change without prior notice.
- The compliance and regulatory information can be downloaded from AudioCodes Web site at <http://www.audiocodes.com/library>.

### Technical Specifications

| Function                             | Specification                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
