1 Introduction

This Configuration Note describes how to set up AudioCodes Enterprise Session Border Controller (hereafter, referred to as *E-SBC*) for interworking between DTAG's SIP Trunk and SWYX IP-PBX environment.

You can also use AudioCodes' SBC Wizard tool to automatically configure the E-SBC based on this interoperability setup. However, it is recommended to read through this document in order to better understand the various configuration options. For more information on AudioCodes' SBC Wizard including download option, visit AudioCodes Web site at <http://www.audicodes.com/sbc-wizard> (login required).

1.1 Intended Audience

The document is intended for engineers, or AudioCodes and DTAG Partners who are responsible for installing and configuring DTAG's SIP Trunk and SWYX IP-PBX for enabling VoIP calls using AudioCodes E-SBC.

1.2 About AudioCodes E-SBC Product Series

AudioCodes' family of E-SBC devices enables reliable connectivity and security between the Enterprise's and the service provider's VoIP networks.

The E-SBC provides perimeter defense as a way of protecting Enterprises from malicious VoIP attacks; mediation for allowing the connection of any PBX and/or IP-PBX to any service provider; and Service Assurance for service quality and manageability.

Designed as a cost-effective appliance, the E-SBC is based on field-proven VoIP and network services with a native host processor, allowing the creation of purpose-built multiservice appliances, providing smooth connectivity to cloud services, with integrated quality of service, SLA monitoring, security and manageability. The native implementation of SBC provides a host of additional capabilities that are not possible with standalone SBC appliances such as VoIP mediation, PSTN access survivability, and third-party value-added services applications. This enables Enterprises to utilize the advantages of converged networks and eliminate the need for standalone appliances.

AudioCodes E-SBC is available as an integrated solution running on top of its field-proven Mediant Media Gateway and Multi-Service Business Router platforms, or as a software-only solution for deployment with third-party hardware.

2 Component Information

2.1 AudioCodes E-SBC Version

Table 2-1: AudioCodes E-SBC Version

SBC Vendor	AudioCodes
Models	<ul style="list-style-type: none"> ▪ Mediant 500 E-SBC ▪ Mediant 500L Gateway & E-SBC ▪ Mediant 800B Gateway & E-SBC ▪ Mediant 1000B Gateway & E-SBC ▪ Mediant 2600 E-SBC ▪ Mediant 4000 SBC ▪ Mediant 4000B SBC ▪ Mediant 9000 SBC ▪ Mediant Software SBC (SE and VE)
Software Version	SIP_7.20A.102.001
Protocol	<ul style="list-style-type: none"> ▪ SIP/TCP (to the DTAG SIP-Trunk) ▪ SIP/UDP (to the SWYX IP-PBX)
Additional Notes	None

2.2 DTAG SIP-Trunk Version

Table 2-2: DTAG SIP-Trunk Version

Vendor/Service Provider	IBM / DTAG
SSW Model/Service	
Software Version	
Protocol	SIP
Additional Notes	None

2.3 SWYX IP-PBX Version

Table 2-3: SWYX IP-PBX Version

Vendor	SWYX
Model	SwyxWare 2015
Software Version	R40
Protocol	SIP
Additional Notes	SIP Client SwyxIt! Version 10.40.2540

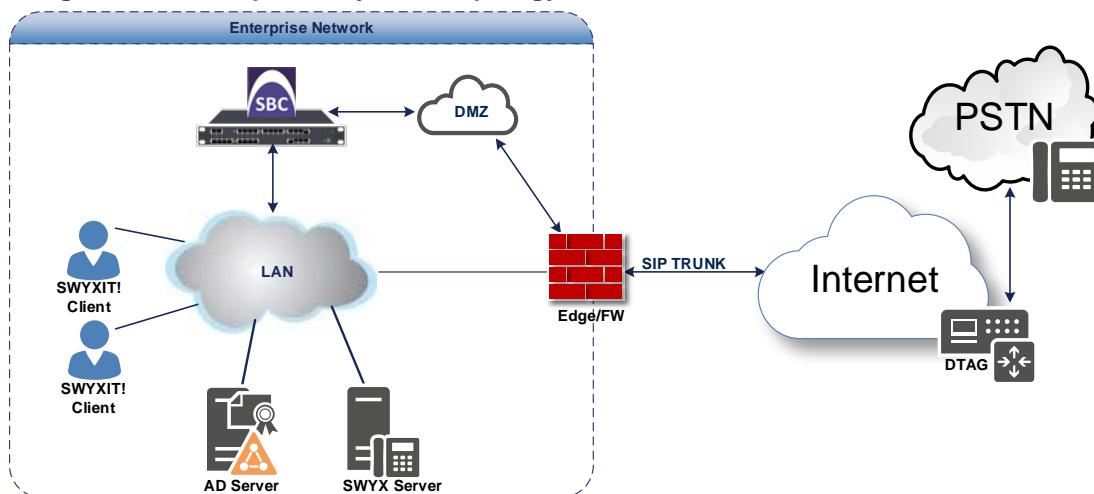

2.4 Interoperability Test Topology

The interoperability testing between AudioCodes E-SBC and DTAG SIP-Trunk with SWYX IP-PBX was done using the following topology setup:

- Enterprise deployed with SwyxWare 2015 Server in its private network for enhanced communication within the Enterprise.
- Enterprise wishes to connect the Enterprise to the PSTN network using DTAG's SIP Trunking service.
- AudioCodes E-SBC is implemented to interconnect between the Enterprise LAN and the SIP Trunk.
 - **Session:** Real-time voice session using the IP-based Session Initiation Protocol (SIP).
 - **Border:** IP-to-IP network border between SWYX's IP-PBX in the Enterprise LAN and DTAG's SIP Trunk located in the public network.

The figure below illustrates this interoperability test topology:

Figure 2-1: Interoperability Test Topology between E-SBC and SWYX with DTAG SIP Trunk

2.4.1 Environment Setup

The interoperability test topology includes the following environment setup:

Table 2-4: Environment Setup

Area	Setup
Network	<ul style="list-style-type: none"> ▪ SwyxWare 2015 Server is located on the Enterprise's LAN ▪ DTAG SIP Trunk is located on the WAN
Signaling Transcoding	<ul style="list-style-type: none"> ▪ SwyxWare 2015 operates with SIP-over-UDP transport type ▪ DTAG SIP Trunk operates with SIP-over-TCP transport type
Codecs Transcoding	<ul style="list-style-type: none"> ▪ Both, SwyxWare 2015 and DTAG SIP Trunk supports G.711A-law and G.711U-law coders
Media Transcoding	<ul style="list-style-type: none"> ▪ Both, SwyxWare 2015 and DTAG SIP Trunk operates with RTP media type

2.4.2 Known Limitations

The following limitation was observed during interoperability tests performed for AudioCodes' E-SBC interworking between SWYX's IP-PBX and DTAG's SIP Trunk:

- If DTAG SIP-Trunk receives one of 5xx responses for example:
 - 503 Service Unavailable
 - 500 Server Internal Error
 DTAG SIP Trunk still sends re-INVITEs and does not disconnect the call.
 To disconnect the call, a message manipulation rule is used to replace the above error response with the '600 Busy Everywhere' response (see Section 4.11 on page 42).

This page is intentionally left blank.

3 Configuring SwyxWare 2015 Server

This chapter describes how to configure SwyxWare 2015 Server to operate with AudioCodes E-SBC.

Note: Number Mapping, Routing Table, and Locations are also necessary for PSTN deployment; however, they are beyond the scope of this document.

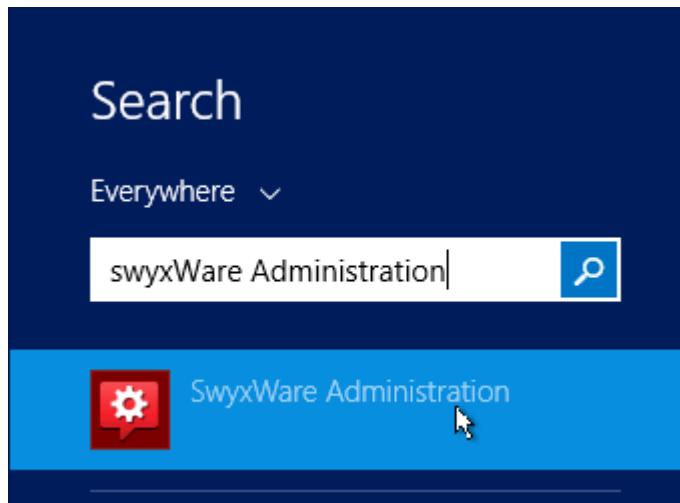

3.1 Configuring AudioCodes E-SBC Trunk on SwyxWare 2015 Server

The procedure below describes how to add the E-SBC in SWYX environment.

➤ **To add E-SBC to the SWYX environment:**

1. On the SwyxWare server, start the SwyxWare Administration (Windows **Start** menu > search for **SwyxWare Administration**), as shown below:

Figure 3-1: Starting the SwyxWare Administration console

The following is displayed:

Figure 3-2: SwyxWare Administration Console

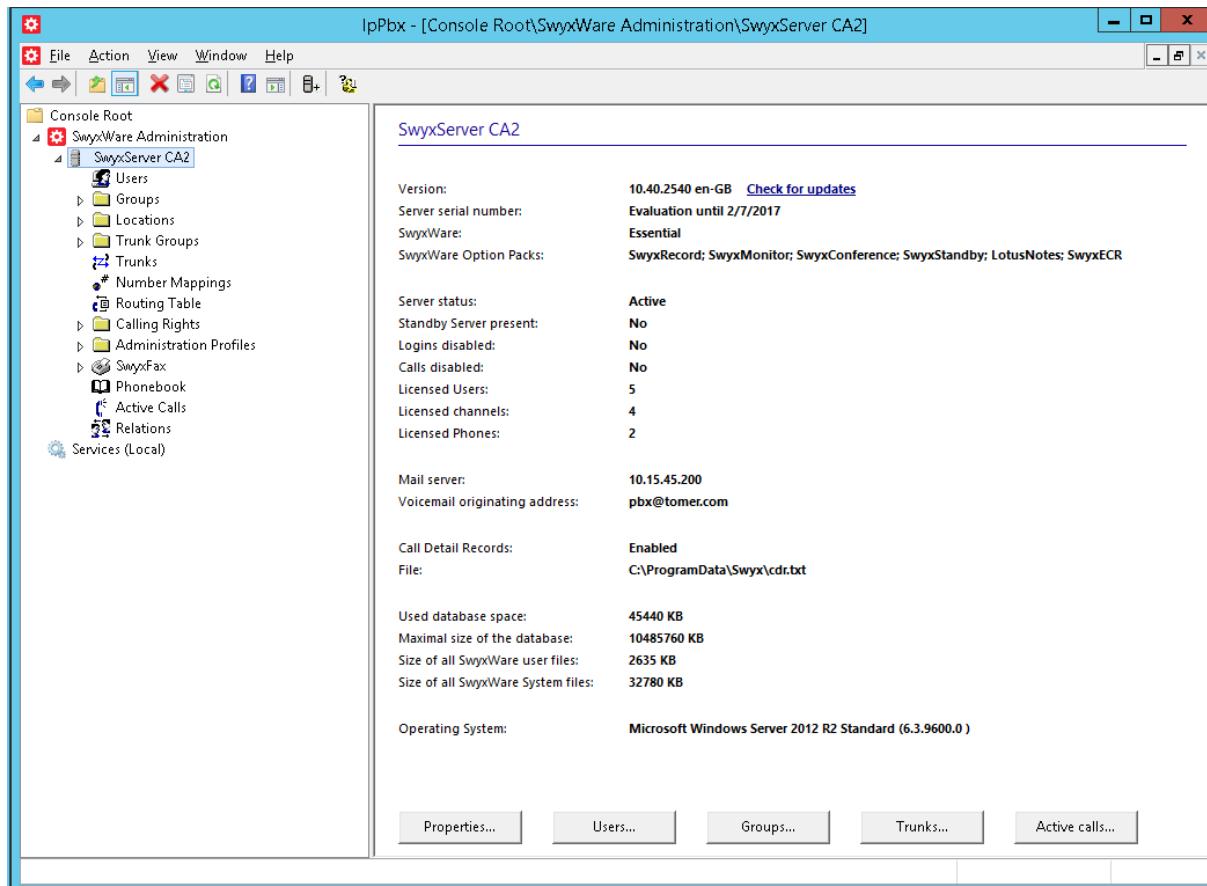

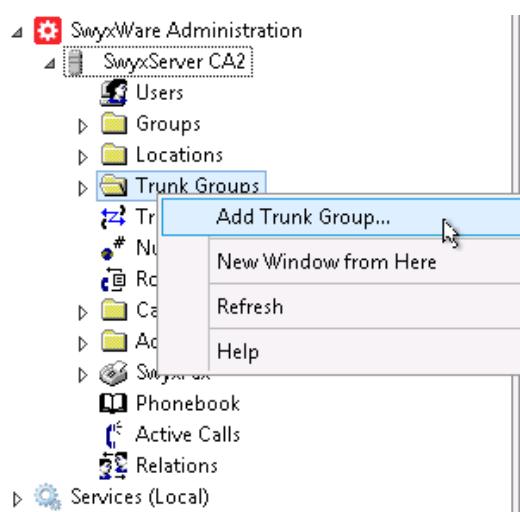

Figure 3-3: Add Trunk Group Dialog Box

2. Select the **Trunk Group** folder, right-click it to **Add Trunk Group**:

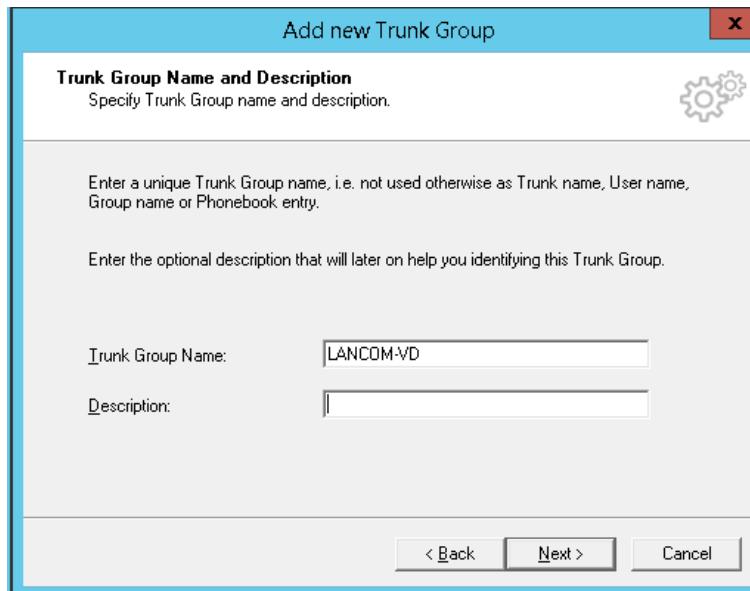

The Trunk Group wizard is displayed:

Figure 3-4: Trunk Group Wizard

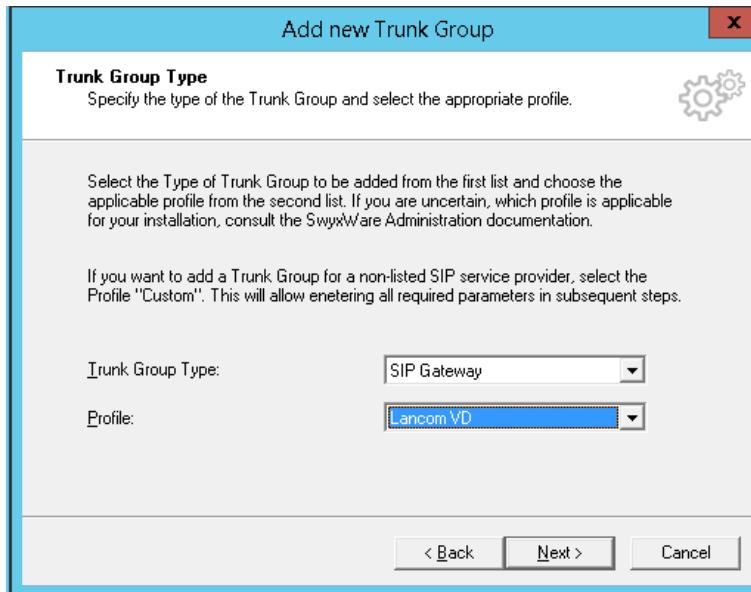

3. Click **Next**.

Figure 3-6: Add LANCOM-VD Trunk Group Name

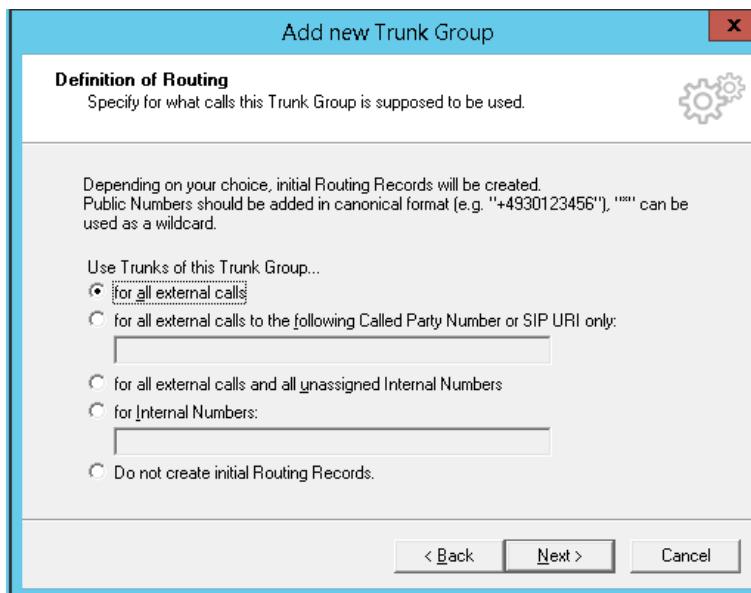

4. Under the **Trunk Group Name** write descriptive name (for e.g., **LANCOM-VD**) and then click **Next**.

Figure 3-5: Define the Trunk Group

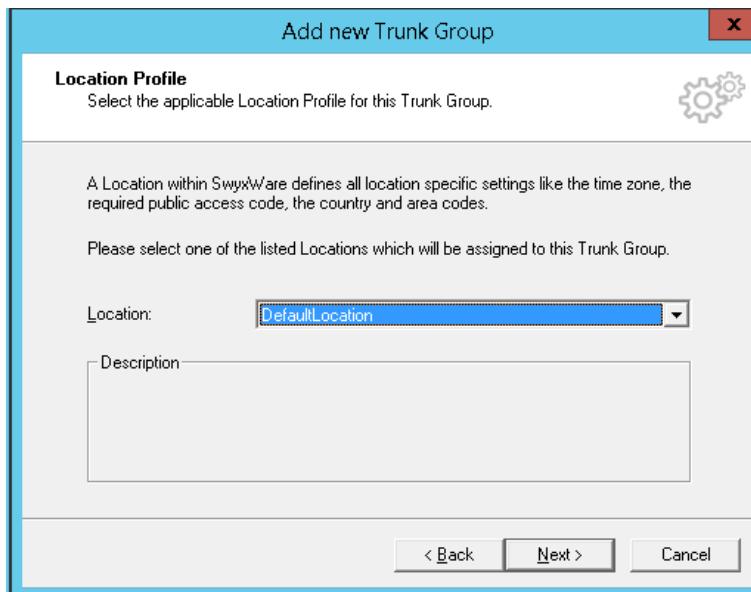

5. Under Trunk Group Type choose **SIP Gateway**
6. Under Profile choose **Lancom VD**
7. Click **Next**

Figure 3-6: Define Routing

8. Set the routing record for your Trunk Group (for example: **for all external calls**) and then click **Next**.

Figure 3-7: Define Location

9. Choose the location profile for your Trunk Group (for example: **DefaultLocation**) and then click **Next**.

Figure 3-8: Finish Trunk Group Wizard

10. Click **Finish** to close the wizard.

The LANCOM-VD Trunk Group is created:

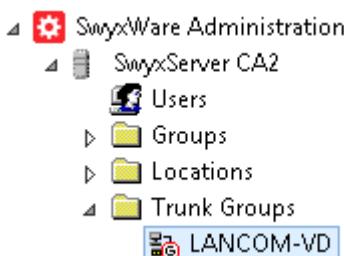

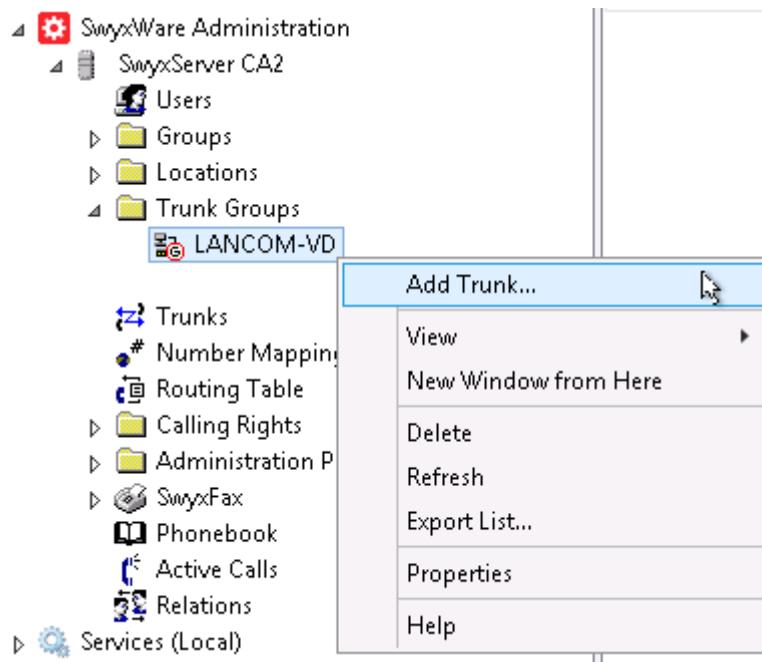

Figure 3-9: LANCOM-VD added as Trunk Group

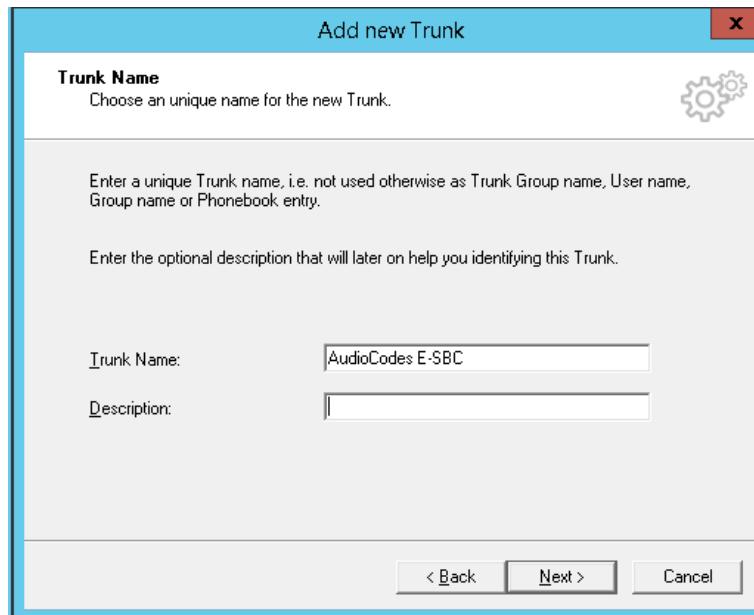

Figure 3-10: Add Trunk

- 11.** Select the created trunk group (LANCOM-VD), right-click it to **Add Trunk**

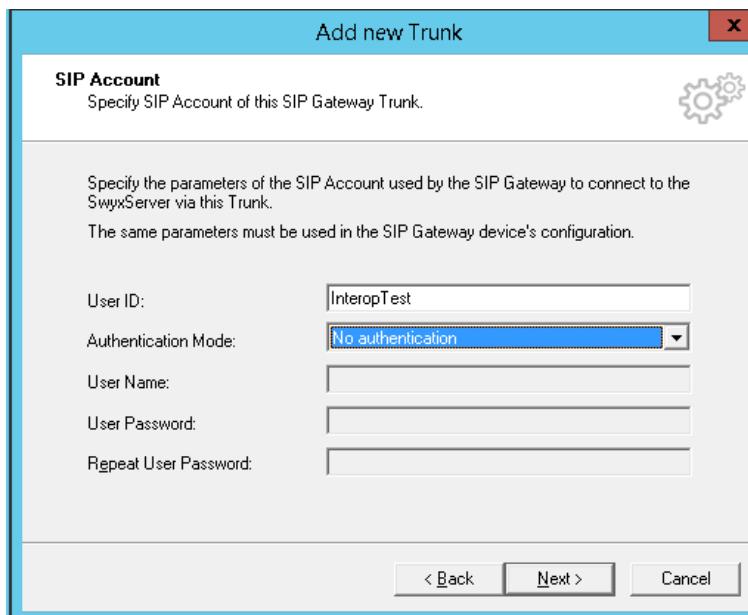

The Trunk wizard is displayed:

Figure 3-11: Trunk Wizard

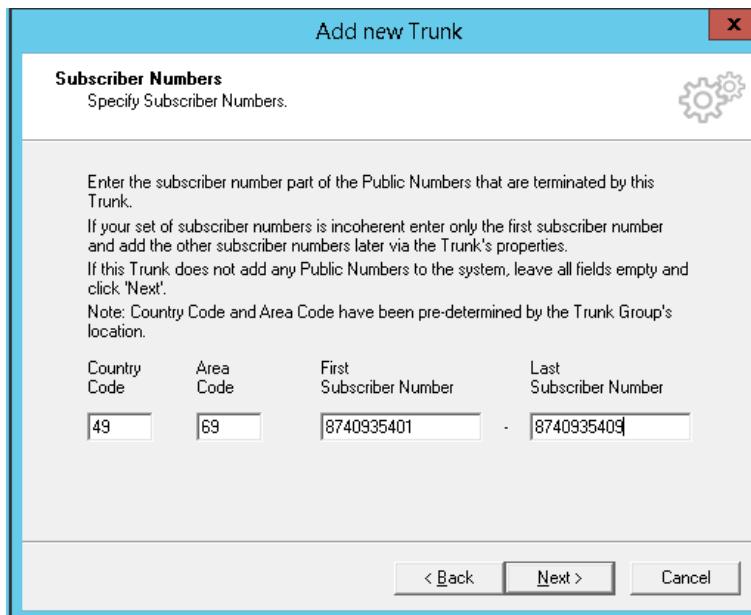

- 12.** Click **Next**.

Figure 3 6: Add AudioCodes E-SBC Trunk Name

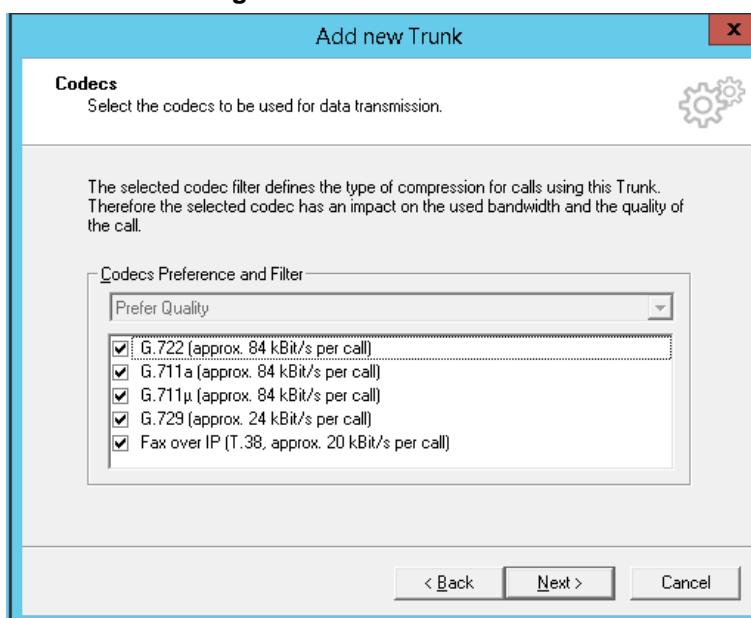

13. Under the **Trunk Name** write the name **AudioCodes E-SBC**, and then click **Next**, as shown below:

Figure 3-12: Define SIP Account

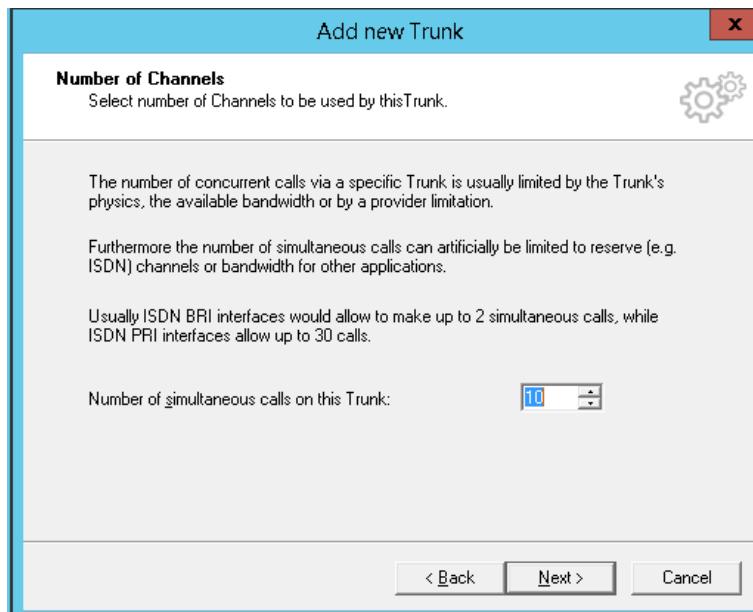

14. Under User ID: Enter the User ID that the SBC will use to register in order to activate the trunk (for example **InteropTest**)
15. Under Authentication Mode choose whether to use authentication or not.
16. If you choose Always Authenticate enter the User Name and Password.
17. Click **Next**.

Figure 3-13: Define Subscriber Numbers

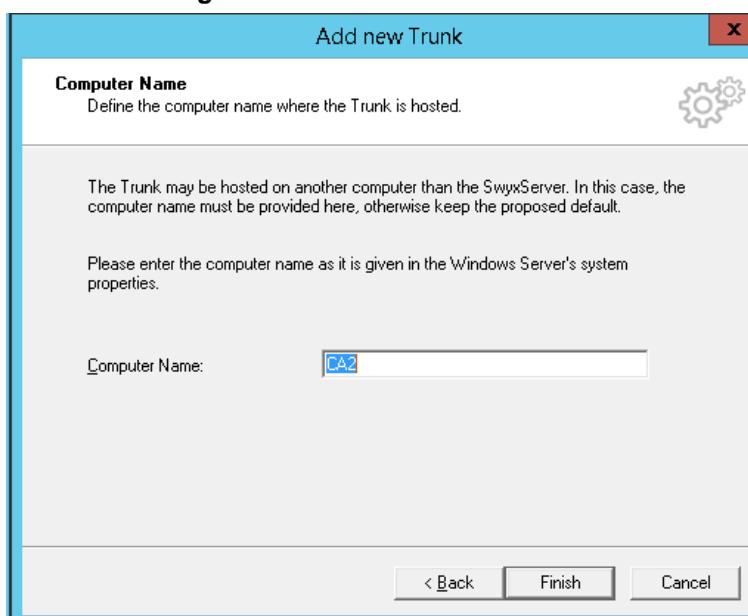

- 18.** Set the subscriber Numbers that associated to the Trunk (for example: **49 69 8740935401 - 8740935409**) and then click **Next**.

Figure 3-14: Define Codecs

- 19.** Choose the Available Codecs for this Trunk and then click **Next**.

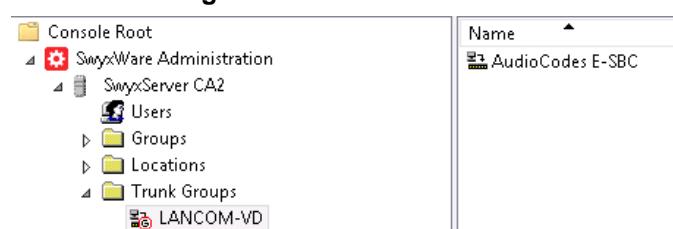

Figure 3-15: Define Number of Channels

- 20.** Choose the Number of Channels available for this Trunk and then click **Next**.

Figure 3-16: Finish Trunk Wizard

- 21.** Click **Finish** to close the wizard.

The AudioCodes E-SBC Trunk is created:

Figure 3-17: AudioCodes E-SBC added as Trunk

This page is intentionally left blank.

4 Configuring AudioCodes E-SBC

This chapter provides step-by-step procedures on how to configure AudioCodes E-SBC for interworking between SWYX IP-PBX and DTAG SIP-Trunk. These configuration procedures are based on the interoperability test topology described in Section 2.4 on page 10, and includes the following main areas:

- E-SBC WAN interface - DTAG SIP Trunking environment
- E-SBC LAN interface - SwyxWare 2015 environment

This configuration is done using the E-SBC's embedded Web server (hereafter, referred to as *Web interface*).

Notes:

- For implementing SWYX IP-PBX and DTAG SIP Trunk based on the configuration described in this section, AudioCodes E-SBC must be installed with a Software License Key that includes the following software features:

- ✓ **SBC**
- ✓ **Security**
- ✓ **RTP**
- ✓ **SIP**

For more information about the Software License Key, contact your AudioCodes sales representative.

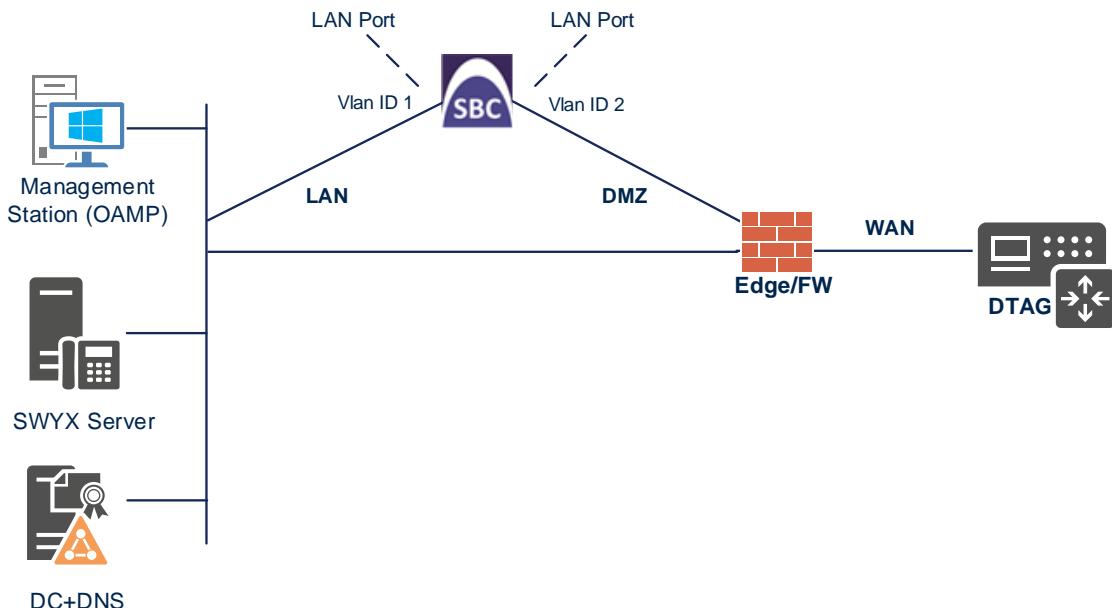

- The scope of this interoperability test and document does **not** cover all security aspects for connecting the SIP Trunk to the SWYX IP-PBX environment. Comprehensive security measures should be implemented per your organization's security policies. For security recommendations on AudioCodes' products, refer to the *Recommended Security Guidelines* document.

4.1 Step 1: IP Network Interfaces Configuration

This step describes how to configure the E-SBC's IP network interfaces. There are several ways to deploy the E-SBC; however, this interoperability test topology employs the following deployment method:

- E-SBC interfaces with the following IP entities:
 - SWYX IP-PBX, located on the LAN
 - DTAG SIP Trunk, located on the WAN
- Physical connection: The type of physical connection to the LAN depends on the method used to connect to the Enterprise's network. In the interoperability test topology, E-SBC connects to the LAN and DMZ using dedicated LAN ports (i.e., two physical ports are used).
- E-SBC also uses two logical network interfaces:
 - LAN (VLAN ID 1)
 - DMZ (VLAN ID 2)

Figure 4-1: Network Interfaces in Interoperability Test Topology

4.1.1 Step 1a: Configure VLANs

This step describes how to define VLANs for each of the following interfaces:

- LAN VoIP (assigned the name "LAN_IF")
- WAN VoIP (assigned the name "WAN_IF")

➤ **To configure the VLANs:**

1. Open the Ethernet Device table (**Setup** menu > **IP Network** tab > **Core Entities** folder > **Ethernet Devices**).
- There will be one existing row for VLAN ID 1 and underlying interface GROUP_1.
2. Add another VLAN ID 2 for the WAN side as follows:

Parameter	Value
Index	1
VLAN ID	2
Underlying Interface	GROUP_2 (Ethernet port group)
Name	vlan 2
Tagging	Untagged

Figure 4-2: Configured VLAN IDs in Ethernet Device

Ethernet Devices (2)				
+ New	Edit		Page 1 of 1	Show 10 records per page
INDEX	VLAN ID	UNDERLYING INTERFACE	NAME	TAGGING
0	1	GROUP_1	vlan 1	Untagged
1	2	GROUP_2	vlan 2	Untagged

4.1.2 Step 1b: Configure Network Interfaces

This step describes how to configure the IP network interfaces for each of the following interfaces:

- LAN VoIP (assigned the name "LAN_IF")
- WAN VoIP (assigned the name "WAN_IF")

➤ **To configure the IP network interfaces:**

1. Open the IP Interfaces table (**Setup** menu > **IP Network** tab > **Core Entities** folder > **IP Interfaces**).
2. Modify the existing LAN network interface:
 - a. Select the 'Index' radio button of the **OAMP + Media + Control** table row, and then click **Edit**.

- b.** Configure the interface as follows:

Parameter	Value
Name	LAN_IF (arbitrary descriptive name)
Ethernet Device	vlan 1
IP Address	10.15.17.77 (LAN IP address of E-SBC)
Prefix Length	16 (i.e., 255.255.0.0)
Default Gateway	10.15.0.1 (LAN router's IP address)
Primary DNS	10.15.27.1

- 3.** Add a network interface for the WAN side:

- c.** Click **New**.

- d.** Configure the interface as follows:

Parameter	Value
Name	WAN_IF (arbitrary descriptive name)
Application Type	Media + Control
Ethernet Device	vlan 2
IP Address	195.189.192.157 (DMZ IP address of E-SBC)
Prefix Length	25 (i.e., 255.255.255.128)
Default Gateway	195.189.192.129 (DMZ router's IP address)
Primary DNS	80.179.52.100
Secondary DNS	80.179.55.100

- 4.** Click **Apply**.

The configured IP network interfaces are shown below:

Figure 4-3: Configured Network Interfaces in IP Interfaces Table

IP Interfaces (2) .										
				Page <input type="text" value="1"/> of 1		Show <input type="button" value="10"/> records per page		<input type="text"/>		
INDEX	NAME	APPLICATION TYPE	INTERFACE MODE	IP ADDRESS	PREFIX LENGTH	DEFAULT GATEWAY	PRIMARY DNS	SECONDARY DNS	ETHERNET DEVICE	
0	LAN_IF	OAMP + Media +	IPv4 Manual	10.15.17.77	16	10.15.0.1	10.15.27.1	0.0.0.0	vlan 1	
1	WAN_IF	Media + Control	IPv4 Manual	195.189.192.157	25	195.189.192.129	80.179.52.100	80.179.55.100	vlan 2	

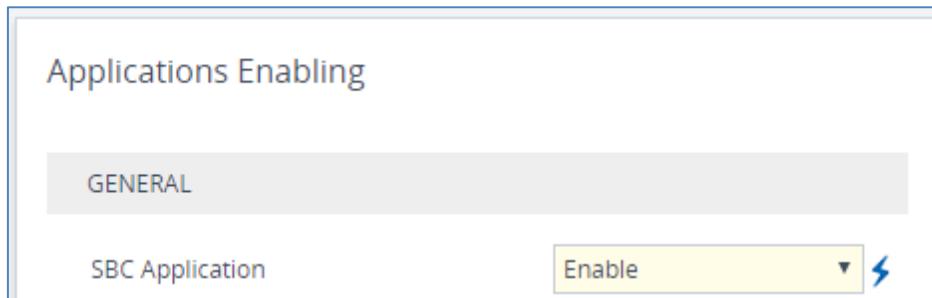

4.2 Step 2: Enable the SBC Application

This step describes how to enable the SBC application.

➤ **To enable the SBC application:**

1. Open the Applications Enabling page (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Applications Enabling**).

Figure 4-4: Enabling SBC Application

2. From the 'SBC Application' drop-down list, select **Enable**.
3. Click **Apply**.
4. Reset the E-SBC with a burn to flash for this setting to take effect (see Section 4.13 on page 46).

4.3 Step 3: Configure Media Realms

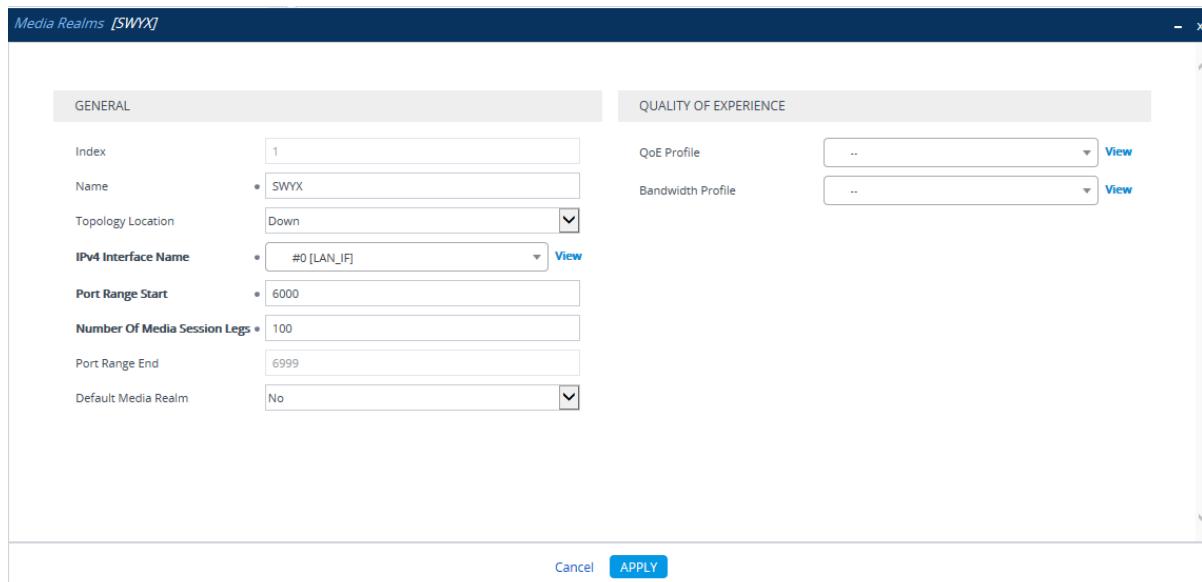

This step describes how to configure Media Realms. The straightforward configuration is to create two Media Realms - one for internal (LAN) traffic and one for external (WAN) traffic.

➤ **To configure Media Realms:**

1. Open the Media Realms table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **Media Realms**).
2. Create a new Media Realm for the LAN interface. You can use the default Media Realm (Index 0), but modify it as shown below:

Parameter	Value
Index	0
Name	SWYX (see note at the end of this section)
IPv4 Interface Name	LAN_IF
Port Range Start	6000 (represents lowest UDP port number used for media on LAN)
Number of Media Session Legs	100 (media sessions assigned with port range)

Figure 4-5: Configuring Media Realm for LAN

The screenshot shows the 'Media Realms [SWYX]' configuration dialog. The 'GENERAL' tab is active, displaying the following settings:

- Index: 1
- Name: SWYX
- Topology Location: Down
- IPv4 Interface Name: #0 [LAN_IF]
- Port Range Start: 6000
- Number Of Media Session Legs: 100
- Port Range End: 6999
- Default Media Realm: No

The 'QUALITY OF EXPERIENCE' tab is present but contains no data.

3. Create New Media Realm for WAN traffic as shown below:

Parameter	Value
Index	1
Name	DTAG (descriptive name)
Topology Location	Up
IPv4 Interface Name	WAN_IF
Port Range Start	7000 (represents lowest UDP port number used for media on WAN)
Number of Media Session Legs	100 (media sessions assigned with port range)

Figure 4-6: Configuring Media Realm for WAN

The configured Media Realms are shown in the figure below:

Figure 4-7: Configured Media Realms in Media Realm Table

Media Realms (2)						
Actions		List View				
INDEX	NAME	IPV4 INTERFACE NAME	PORT RANGE START	NUMBER OF MEDIA SESSION LEGS	PORT RANGE END	DEFAULT MEDIA REALM
1	SWYX	LAN_IF	6000	100	6999	No
2	DTAG	WAN_IF	7000	100	7999	No

Note: Current software releases uses the string **names** of the configuration entities (e.g., SIP Interface, Proxy Sets, and IP Groups). Therefore, it is recommended to configure each configuration entity with meaningful names for easy identification.

4.4 Step 4: Configure SIP Signaling Interfaces

This step describes how to configure SIP Interfaces. For the interoperability test topology, an internal and external SIP Interface must be configured for the E-SBC.

➤ **To configure SIP Interfaces:**

1. Open the SIP Interfaces table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **SIP Interfaces**).
2. Create New SIP Interface for the LAN interface. You can use the default SIP Interface (Index 0), but modify it as shown below:

Parameter	Value
Index	0
Name	SWYX
Network Interface	LAN_IF
Application Type	SBC
UDP	5060
TCP and TLS	0
Media Realm	SWYX

3. Create New SIP Interface for the WAN as shown below:

Parameter	Value
Index	1
Name	DTAG
Network Interface	WAN_IF
Application Type	SBC
TCP Port	5060
UDP and TLS	0
Media Realm	DTAG

The configured SIP Interfaces are shown in the figure below:

Figure 4-8: Configured SIP Interfaces in SIP Interface Table

SIP Interfaces (2)									
Actions		Search							
INDEX	NAME	SRD	NETWORK INTERFACE	APPLICATION TYPE	UDP PORT	TCP PORT	TLS PORT	ENCAPSULATION PROTOCOL	MEDIA REALM
1	SWYX	defaultSRD	LAN_IF	SBC	5060	0	0	No encapsulation	SWYX
2	DTAG	defaultSRD	WAN_IF	SBC	0	5060	0	No encapsulation	DTAG

4.5 Step 5: Configure Proxy Sets

This step describes how to configure Proxy Sets. The Proxy Set defines the destination address (IP address or FQDN) of the IP entity server. Proxy Sets can also be used to configure load balancing between multiple servers.

For the interoperability test topology, two Proxy Sets need to be configured for the following IP entities:

- SwyxWare 2015 Server
- DTAG SIP Trunking

The Proxy Sets will be later applying to the VoIP network by assigning them to IP Groups.

➤ To configure Proxy Sets:

1. Open the Proxy Sets table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder >**Proxy Sets**).
2. Create New Proxy Set for the SwyxWare Server 2015 as shown below:

Parameter	Value
Index	1
Name	SWYX
SBC IPv4 SIP Interface	SWYX
Proxy Keep-Alive	Using Options

Figure 4-9: Configuring Proxy Set for SwyxWare 2015 server

3. Select the index row of the Proxy Set that you added, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.
4. Click **New**; the following dialog box appears:

Figure 4-10: Configuring Proxy Address for SwyxWare Server 2015

GENERAL	
Index	0
Proxy Address	10.15.27.3:5060
Transport Type	UDP

5. Configure a SIP address for the Proxy Set; see example in the table below:

Parameter	Value
Index	0
Proxy Address	10.15.27.3:5060 (SwyxWare Server 2015 IP address / FQDN and destination port)
Transport Type	UDP

6. Create a new Proxy Set for the DTAG SIP Trunk as shown below:

Parameter	Value
Index	2
Name	DTAG
SBC IPv4 SIP Interface	DTAG
Proxy Keep-Alive	Using Options
Redundancy Mode	Homing
Proxy Hot Swap	Enable
DNS Resolve Method	SRV

Figure 4-11: Configuring Proxy Set for DTAG SIP Trunking

The screenshot shows the 'Proxy Sets [DTAG]' configuration dialog box. The 'GENERAL' tab contains fields for Index (2), Name (DTAG), Gateway IPv4 SIP Interface (..), SBC IPv4 SIP Interface (#2 [DTAG]), and TLS Context Name (..). The 'REDUNDANCY' tab includes Redundancy Mode (Homing), Proxy Hot Swap (Enable), Proxy Load Balancing Method (Disable), and Min. Active Servers for Load Balancing (1). The 'ADVANCED' tab shows Classification Input (IP Address only) and DNS Resolve Method (SRV).

7. Select the index row of the Proxy Set that you added, and then click the **Proxy Address** link located below the table; the Proxy Address table opens.
8. Click **New**; the following dialog box appears:

Figure 4-12: Configuring Proxy Address for DTAG SIP Trunking

The screenshot shows the 'Proxy Address' configuration dialog box. It has a 'GENERAL' tab with fields for Index (0), Proxy Address (register-test.sip-trunk.telekom.de), and Transport Type (TCP).

9. Configure the SIP address for the Proxy Set; see example in the table below:

Parameter	Value
Index	0
Proxy Address	register-test.sip-trunk.telekom.de (IP address / FQDN and destination port)
Transport Type	TCP

The configured Proxy Sets are shown in the figure below:

Figure 4-13: Configured Proxy Sets in Proxy Sets Table

The screenshot shows the 'Proxy Sets (2)' table. It lists two entries: SWYX and DTAG. The table columns include INDEX, NAME, SRD, GATEWAY IPv4 SIP INTERFACE, SBC IPv4 SIP INTERFACE, PROXY KEEP-ALIVE TIME (SEC), REDUNDANCY MODE, and PROXY HOT SWAP.

INDEX	NAME	SRD	GATEWAY IPv4 SIP INTERFACE	SBC IPv4 SIP INTERFACE	PROXY KEEP-ALIVE TIME (SEC)	REDUNDANCY MODE	PROXY HOT SWAP
1	SWYX	defaultSRD (#1)	--	SWYX	60		Disable
2	DTAG	defaultSRD (#1)	--	DTAG	60	Homing	Enable

4.6 Step 6: Configure IP Profiles

This step describes how to configure IP Profiles. The IP Profile defines a set of call capabilities relating to signaling (e.g., SIP message terminations such as REFER) and media (e.g., coder and transcoding method).

In this interoperability test topology, IP Profiles need to be configured for the following IP entities:

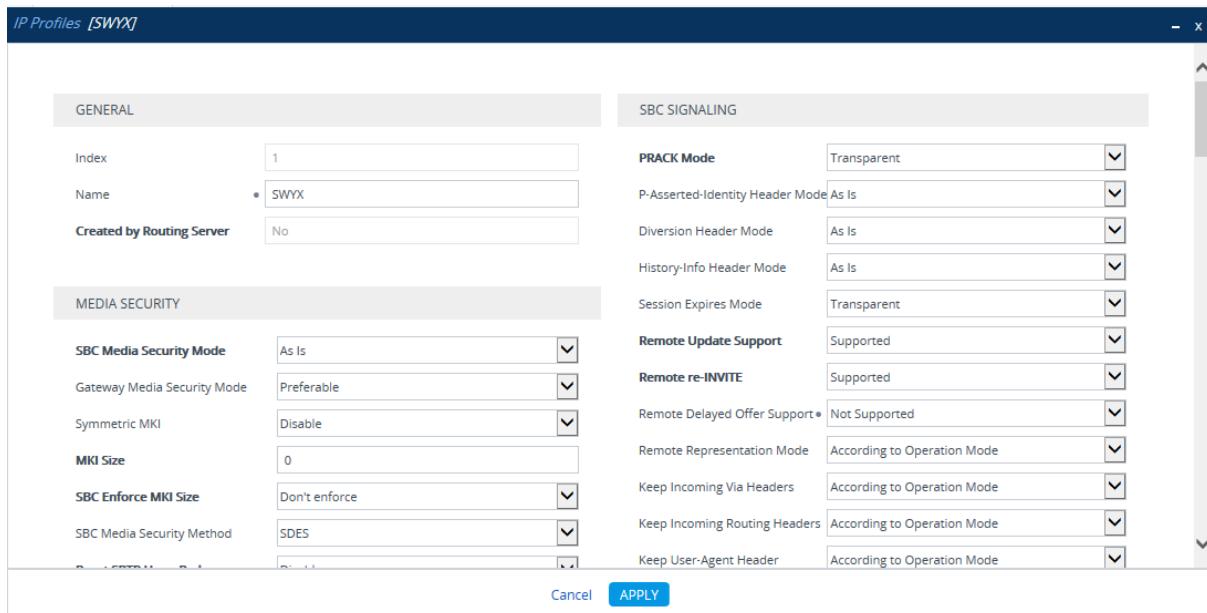

- SWYX IP-PBX
- DTAG SIP-trunk

➤ To configure IP Profiles:

1. Open the IP Profiles table (**Setup** menu > **Signaling & Media** tab > **Coders & Profiles** folder > **IP Profiles**).
2. Create New IP Profile for the SYWYX IP-PBX as shown below:

Parameter	Value
General	
Index	1
Name	SWYX
SBC Signaling	
Remote Delayed Offer Support	Not Supported (required, as SWYX doesn't support it due incoming REFER)

Figure 4-14: Configuring IP Profile for SWYX

The screenshot shows the 'IP Profiles [SWYX]' configuration window. It contains two main tabs: 'GENERAL' and 'SBC SIGNALING'. The 'GENERAL' tab includes fields for Index (1), Name (SWYX), and Created by Routing Server (No). The 'SBC SIGNALING' tab includes various configuration options such as PRACK Mode (Transparent), P-Asserted-Identity Header Mode (As Is), Diversion Header Mode (As Is), History-Info Header Mode (As Is), Session Expires Mode (Transparent), Remote Update Support (Supported), Remote re-INVITE (Supported), Remote Delayed Offer Support (Not Supported), Remote Representation Mode (According to Operation Mode), Keep Incoming Via Headers (According to Operation Mode), Keep Incoming Routing Headers (According to Operation Mode), and Keep User-Agent Header (According to Operation Mode). At the bottom, there are 'Cancel' and 'APPLY' buttons.

3. Create New IP Profile for the DTAG SIP-Trunk as shown below:

Parameter	Value
General	
Index	2
Name	DTAG
SBC Early Media	
Remote Multiple 18x	No (required, as DTAG does not able to handle multiple 18x ringback tone in call forwarding scenario)
SBC Forward and Transfer	
Remote REFER Mode	Handle Locally (required, as for DTAG does not support receipt of SIP REFER)

Figure 4-15: Configuring IP Profile for DTAG SIP Trunk

The screenshot shows the 'IP Profiles [DTAG]' configuration window with the following settings:

- GENERAL** tab:
 - Index: 3
 - Name: DTAG
 - Created by Routing Server: No
- MEDIA SECURITY** tab:
 - SBC Media Security Mode: As Is
 - Gateway Media Security Mode: Preferable
 - Symmetric MKI: Disable
 - MKI Size: 0
 - SBC Enforce MKI Size: Don't enforce
 - SBC Media Security Method: SDES
- SBC SIGNALING** tab:
 - PRACK Mode: Transparent
 - P-Asserted-Identity Header Mode: As Is
 - Diversion Header Mode: As Is
 - History-Info Header Mode: As Is
 - Session Expires Mode: Transparent
 - Remote Update Support: Supported
 - Remote re-INVITE: Supported
 - Remote Delayed Offer Support: Supported
 - Remote Representation Mode: According to Operation Mode
 - Keep Incoming Via Headers: According to Operation Mode
 - Keep Incoming Routing Headers: According to Operation Mode
 - Max Call Duration [min]: 0
- SBC FORWARD AND TRANSFER** tab:
 - Remote REFER Mode: Handle Locally
 - Remote Replaces Mode: Standard

4.7 Step 7: Configure IP Groups

This step describes how to configure IP Groups. The IP Group represents an IP entity on the network with which the E-SBC communicates. This can be a server (e.g., IP PBX or ITSP) or it can be a group of users (e.g., IP phones). For servers, the IP Group is typically used to define the server's IP address by associating it with a Proxy Set. Once IP Groups are configured, they are used to configure IP-to-IP routing rules for denoting source and destination of the call.

In this interoperability test topology, IP Groups must be configured for the following IP entities:

- SWYX IP-PBX
- DTAG SIP-Trunk

➤ **To configure IP Groups:**

1. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
2. Create a new IP Group for the SYWX IP-PBX as shown below:

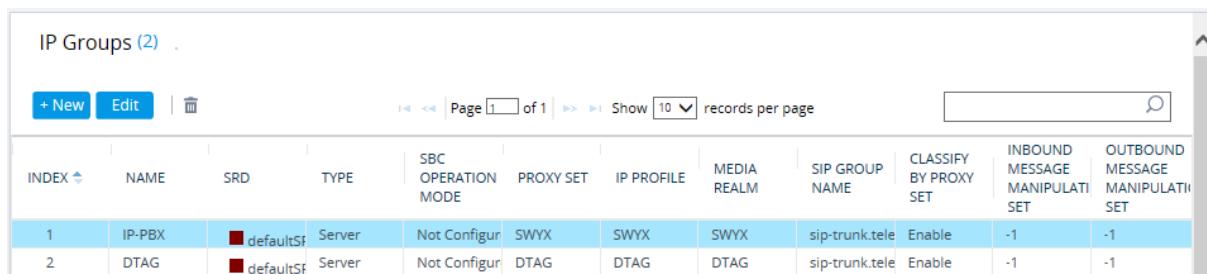

Parameter	Value
Index	1
Name	SWYX
Type	Server
Proxy Set	SWYX
IP Profile	SWYX
Media Realm	SWYX
SIP Group Name	sip-trunk.telekom.de (according to ITSP requirement)
Destination URI Input	TO (SWYX destination number is located on the to-header)

3. Create a new an IP Group for the DTAG SIP-Trunk as shown below:

Parameter	Value
Index	2
Name	DTAG
Topology Location	Up
Type	Server
Proxy Set	DTAG
IP Profile	DTAG
Media Realm	DTAG
SIP Group Name	sip-trunk.telekom.de (according to ITSP requirement)

The configured IP Groups are shown in the figure below:

Figure 4-16: Configured IP Groups in IP Group Table

IP Groups (2)											
INDEX	NAME	SRD	TYPE	SBC OPERATION MODE	PROXY SET	IP PROFILE	MEDIA REALM	SIP GROUP NAME	CLASSIFY BY PROXY SET	INBOUND MESSAGE MANIPULATION SET	OUTBOUND MESSAGE MANIPULATION SET
1	IP-PBX	defaultSf	Server	Not Configured	SWYX	SWYX	SWYX	sip-trunk.tele	Enable	-1	-1
2	DTAG	defaultSf	Server	Not Configured	DTAG	DTAG	DTAG	sip-trunk.tele	Enable	-1	-1

4.8 Step 8: Configure Maximum IP Media Channels

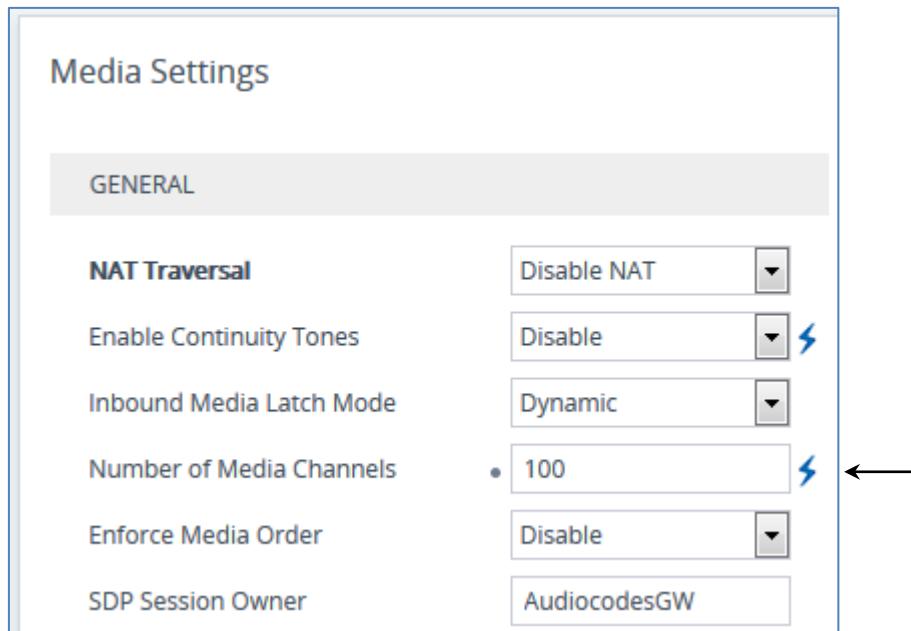

This step describes how to configure the maximum number of required IP media channels. The number of media channels represents the number of DSP channels that the E-SBC allocates to call sessions.

Note: This step is required **only** if transcoding is required. In this Interoperability tests topology Media Channels **wasn't required**.

- To configure the maximum number of IP media channels:
 1. Open the Media Settings page (**Setup** menu > **Signaling & Media** tab > **Media** folder > **Media Settings**).

Figure 4-17: Configuring Number of Media Channels

The screenshot shows the 'Media Settings' configuration page with the 'GENERAL' tab selected. Under the 'NAT Traversal' section, there is a dropdown menu set to 'Disable NAT'. Below it, under 'Enable Continuity Tones', there is a dropdown menu set to 'Disable'. In the 'Inbound Media Latch Mode' section, a dropdown menu is set to 'Dynamic'. The 'Number of Media Channels' section contains a dropdown menu with '100' selected, indicated by a blue lightning bolt icon. Under 'Enforce Media Order', a dropdown menu is set to 'Disable'. At the bottom, the 'SDP Session Owner' field is set to 'AudiocodesGW'.

2. In the 'Number of Media Channels' field, enter the number of media channels according to your environments transcoding calls (e.g., **100**).
3. Click **Apply**.
4. Reset the E-SBC with a burn to flash for your settings to take effect (see Section 4.13 on page 46).

4.9 Step 9: Configure IP-to-IP Call Routing Rules

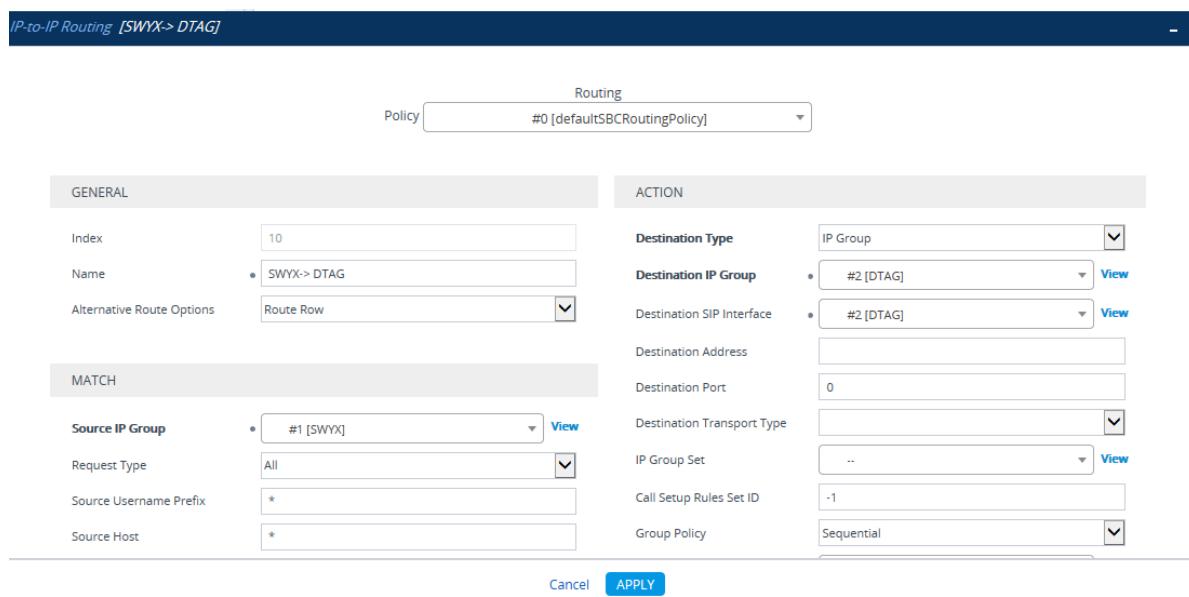

This step describes how to configure IP-to-IP call routing rules. These rules define the routes for forwarding SIP messages (e.g., INVITE) received from one IP entity to another. The E-SBC selects the rule whose configured input characteristics (e.g., IP Group) match those of the incoming SIP message. If the input characteristics do not match the first rule in the table, they are compared to the second rule, and so on, until a matching rule is located. If no rule is matched, the message is rejected. The routing rules typically uses the configured IP Groups (as configured in Section 4.6 on page 33,) to denote the source and destination of the call.

For the interoperability test topology, the following IP-to-IP routing rules need to be configured:

- Calls from SWYX IP-PBX to DTAG SIP Trunk
 - Calls from DTAG SIP Trunk to SWYX IP-PBX
1. Create a new rule to route calls from SWYX IP-PBX to DTAG SIP Trunk as shown below:

Parameter	Value
Index	1
Route Name	SWYX → DTAG (descriptive name)
Source IP Group	SWYX
Destination Type	IP Group
Destination IP Group	DTAG
Destination SIP Interface	DTAG

Figure 4-18: Configuring IP-to-IP Routing Rule from SWYX to DTAG

The screenshot shows the configuration interface for the "SWYX->DTAG" routing rule. The top navigation bar indicates the current view is "Routing Policy #0 [defaultSBCRoutingPolicy]".

GENERAL tab settings:

- Index: 10
- Name: SWYX-> DTAG
- Alternative Route Options: Route Row

ACTION tab settings:

- Destination Type: IP Group
- Destination IP Group: #2 [DTAG]
- Destination SIP Interface: #2 [DTAG]
- Destination Address: (empty)
- Destination Port: 0
- Destination Transport Type: (dropdown menu)
- IP Group Set: ..
- Call Setup Rules Set ID: -1
- Group Policy: Sequential

MATCH tab settings:

- Source IP Group: #1 [SWYX]
- Request Type: All
- Source Username Prefix: *
- Source Host: *

At the bottom right are "Cancel" and "APPLY" buttons.

2. Create a new rule to route calls from DTAG SIP to SWYX IP-PBX Trunk as shown below:

Parameter	Value
Index	2
Route Name	DTAG → SYWX (descriptive name)
Source IP Group	DTAG
Destination Type	IP Group
Destination IP Group	SYWX
Destination SIP Interface	SYWX

Figure 4-19: Configuring IP-to-IP Routing Rule from DTAG to SYWX

The screenshot shows the 'IP-to-IP Routing [DTAG->SWYX]' configuration page. At the top, it displays the 'Policy' as '#0 [defaultSBCRoutingPolicy]'. The main area is divided into 'GENERAL' and 'ACTION' tabs. Under 'GENERAL', the 'Index' is set to 20, 'Name' is 'DTAG -> SYWX', and 'Alternative Route Options' is set to 'Route Row'. Under 'ACTION', the 'Destination Type' is 'IP Group', 'Destination IP Group' is '#1 [SYWX]', 'Destination SIP Interface' is '#1 [SYWX]', 'Destination Address' is empty, 'Destination Port' is 0, 'Destination Transport Type' is empty, 'IP Group Set' is empty, 'Call Setup Rules Set ID' is -1, and 'Group Policy' is 'Sequential'. Under 'MATCH', the 'Source IP Group' is '#2 [DTAG]', 'Request Type' is 'All', 'Source Username Prefix' is '*', and 'Source Host' is *. At the bottom right are 'Cancel' and 'APPLY' buttons.

The configured routing rules are shown in the figure below:

Figure 4-20: Configured IP-to-IP Routing Rules in IP-to-IP Routing Table

The screenshot shows the 'IP-to-IP Routing (2)' table. The columns are INDEX, NAME, ROUTING POLICY, ALTERNATIVE ROUTE OPTIONS, SOURCE IP GROUP, REQUEST TYPE, SOURCE USERNAME PREFIX, DESTINATION USERNAME PREFIX, DESTINATION TYPE, DESTINATION IP GROUP, DESTINATION SIP INTERFACE, and DESTINATION ADDRESS. There are two rows: Row 10 has INDEX 10, NAME 'SWYX - DTAG', ROUTING POLICY 'defaultSBCRo', ALTERNATIVE ROUTE OPTIONS 'Route Row', SOURCE IP GROUP 'SWYX', REQUEST TYPE 'All', SOURCE USERNAME PREFIX '*', DESTINATION USERNAME PREFIX '*', DESTINATION TYPE 'IP Group', DESTINATION IP GROUP 'DTAG', DESTINATION SIP INTERFACE 'DTAG', and DESTINATION ADDRESS empty. Row 20 has INDEX 20, NAME 'DTAG - SYWX', ROUTING POLICY 'defaultSBCRo', ALTERNATIVE ROUTE OPTIONS 'Route Row', SOURCE IP GROUP 'DTAG', REQUEST TYPE 'All', SOURCE USERNAME PREFIX '*', DESTINATION USERNAME PREFIX '*', DESTINATION TYPE 'IP Group', DESTINATION IP GROUP 'SYWX', DESTINATION SIP INTERFACE 'SYWX', and DESTINATION ADDRESS empty.

Note: The routing configuration may change according to your specific deployment topology.

4.10 Step 10: Configure IP-to-IP Manipulation Rules

This step describes how to configure IP-to-IP manipulation rules. These rules manipulate the SIP Request-URI user part (source or destination number). The manipulation rules use the configured IP Groups (as configured in Section 4.6 on page 33) to denote the source and destination of the call.

For this interoperability test topology, a manipulation rule is configured for "00" destination username prefix to remove the "00" and add the "+" (plus sign) to the destination number for calls from SWYX IP Group to DTAG IP Group.

➤ **To configure a number manipulation rule:**

1. Open the Outbound Manipulations table (**Setup** menu > **Signaling & Media** tab > **SBC** folder > **Manipulation** > **Outbound Manipulations**).
2. Create a new Number Manipulation rule as shown below:

Parameter	Value
Index	0
Name	PBX→ITSP
Source IP Group	SWYX
Destination IP Group	DTAG
Destination Username Prefix	00
Manipulated Item	Destination URI
Remove From Left	2
Prefix to Add	+

Figure 4-21: Configuring IP-to-IP Outbound Manipulation Rule

Outbound Manipulations [PBX->ITSP]

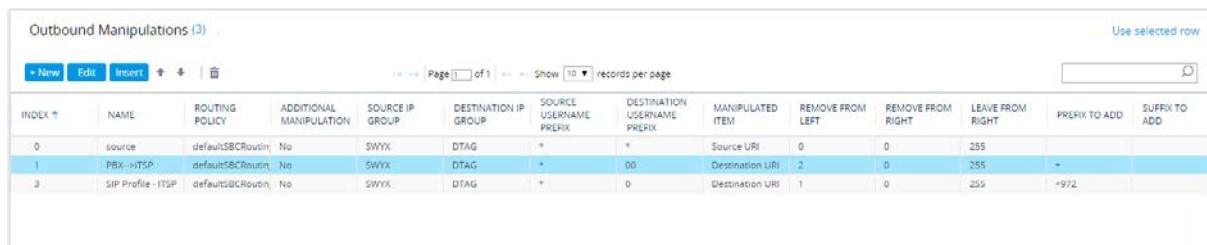

ROUTING	
Policy	#0 [defaultSBCRoutingPolicy]
GENERAL	
Index	1
Name	PBX->ITSP
Additional Manipulation	No
Call Trigger	Any
MATCH	
Request Type	All
Source IP Group	#1 [SWYX]
Destination IP Group	#2 [DTAG]
ACTION	
Manipulated Item	Destination URI
Remove From Left	2
Remove From Right	0
Leave From Right	255
Prefix to Add	+
Suffix to Add	
Privacy Restriction Mode	Transparent

Cancel **APPLY**

The table below shows an example of configured IP-to-IP outbound manipulation rules for calls between SWYX IP Group and DTAG SIP Trunk IP Group:

Rule Index	Description
0	For calls from SWYX IP Group to DTAG IP Group with any Source (*), add "+" to the prefix of the Source number.
1	For calls from SWYX IP Group to DTAG IP Group with the prefix destination number "00", remove "00" from this prefix and add "+" to the prefix of the destination number.
2	For calls from SWYX IP Group to DTAG IP Group with the prefix destination number "0", remove "0" from this prefix and add "+972" to the prefix of the destination number.

Figure 4-22: Example of Configured IP-to-IP Outbound Manipulation Rules

The screenshot shows a table titled "Outbound Manipulations (3)". The columns are: INDEX, NAME, ROUTING POLICY, ADDITIONAL MANIPULATION, SOURCE IP GROUP, DESTINATION IP GROUP, SOURCE USERNAME PREFIX, DESTINATION USERNAME PREFIX, MANIPULATED ITEM, REMOVE FROM LEFT, REMOVE FROM RIGHT, LEAVE FROM RIGHT, PREFIX TO ADD, and SUFFIX TO ADD. The rows are:

INDEX	NAME	ROUTING POLICY	ADDITIONAL MANIPULATION	SOURCE IP GROUP	DESTINATION IP GROUP	SOURCE USERNAME PREFIX	DESTINATION USERNAME PREFIX	MANIPULATED ITEM	REMOVE FROM LEFT	REMOVE FROM RIGHT	LEAVE FROM RIGHT	PREFIX TO ADD	SUFFIX TO ADD
0	source	defaultSBCRoute	No	SWYX	DTAG	*	*	Source URI	0	0	255		
1	PBX->ITSP	defaultSBCRoute	No	SWYX	DTAG	*	00	Destination URI	2	0	255	-	
3	SIP Profile - ITSP	defaultSBCRoute	No	SWYX	DTAG	*	0	Destination URI	1	0	255	+972	

Note: Adapt the manipulation table according to your environment dial plan.

4.11 Step 11: Configure Message Manipulation Rules

This step describes how to configure SIP message manipulation rules. SIP message manipulation rules can include insertion, removal, and/or modification of SIP headers. Manipulation rules are grouped into Manipulation Sets, enabling you to apply multiple rules to the same SIP message (IP entity).

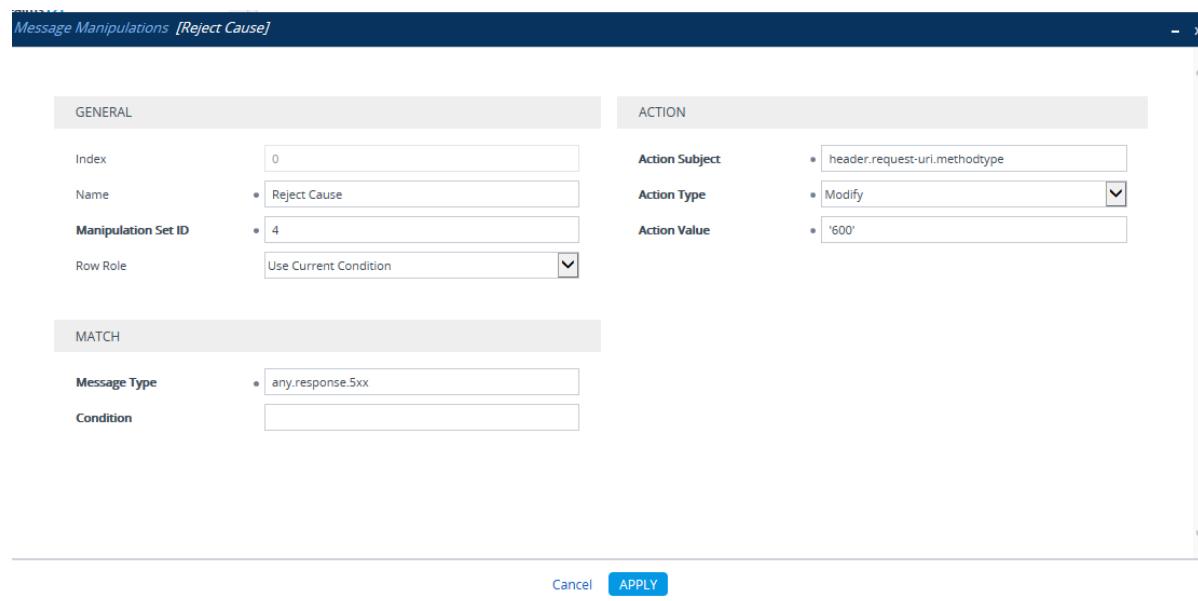

Once you have configured the SIP message manipulation rules, you need to assign them to the relevant IP Group (in the IP Group table) and determine whether they must be applied to inbound or outbound messages.

➤ **To configure SIP message manipulation rule:**

1. Open the Message Manipulations page (**Setup** menu > **Signaling & Media** tab > **Message Manipulation** folder > **Message Manipulations**).
2. Configure a new manipulation rule (Manipulation Set 4) for DTAG SIP Trunk. This rule applies to response messages sent to the DTAG SIP Trunk IP Group for Rejected Calls initiated by the SWYX IP Group or SBC. This rule replaces the method types '5xx' with the value '600' (Busy Everywhere), since DTAG SIP Trunk does not disconnect the call immediately after receiving '5xx' method types.

Parameter	Value
Index	0
Name	Reject Cause
Manipulation Set ID	4
Message Type	any.response.5xx
Action Subject	header.request-uri.methodtype
Action Type	Modify
Action Value	'600'

Figure 4-23: Configuring SIP Message Manipulation Rule 0 (for DTAG SIP Trunk)

The screenshot shows the 'Message Manipulations [Reject Cause]' configuration dialog. It consists of three main sections: GENERAL, ACTION, and MATCH.

- GENERAL:**
 - Index: 0
 - Name: Reject Cause
 - Manipulation Set ID: 4
 - Row Role: Use Current Condition
- ACTION:**
 - Action Subject: header.request-uri.methodtype
 - Action Type: Modify
 - Action Value: '600'
- MATCH:**
 - Message Type: any.response.5xx
 - Condition: (empty)

At the bottom right are 'Cancel' and 'APPLY' buttons.

Figure 4-24: Configured SIP Message Manipulation Rule

The screenshot shows a table titled 'Message Manipulations (1)'. The table has columns: INDEX, NAME, MANIPULATION SET ID, MESSAGE TYPE, CONDITION, ACTION SUBJECT, ACTION TYPE, ACTION VALUE, and ROW ROLE. There is one row with the following values:

INDEX	NAME	MANIPULATION SET ID	MESSAGE TYPE	CONDITION	ACTION SUBJECT	ACTION TYPE	ACTION VALUE	ROW ROLE
0	Reject Cause	4	any.response.5xx		header.request-uri	Modify	'600'	Use Current Condit

3. Assign Manipulation Set ID 4 to the DTAG SIP Trunk IP Group:
 - a. Open the IP Groups table (**Setup** menu > **Signaling & Media** tab > **Core Entities** folder > **IP Groups**).
 - b. Select the row of the DTAG SIP trunk IP Group, and then click **Edit**.
 - c. Set the 'Outbound Message Manipulation Set' field to 4.

Figure 4-25: Assigning Manipulation Set 4 to the DTAG SIP Trunk IP Group

The screenshot shows the 'IP Groups [DTAG]' configuration page. In the 'GENERAL' section, the 'Outbound Message Manipulation Set' field is set to 4. Other fields include Index (2), Name (DTAG), Topology Location (Up), Type (Server), Proxy Set (#2 [DTAG]), IP Profile (#3 [DTAG]), Media Realm (#2 [DTAG]), Contact User, SIP Group Name (sip-trunk.telekom.de), and Created By Routing Server (No). In the 'MESSAGE MANIPULATION' section, the Outbound Message Manipulation Set is also set to 4. The 'APPLY' button is visible at the bottom right.

- d. Click **Apply**.

4.12 Step 12: Configure Registration Accounts

This step describes how to configure SIP registration accounts, which are required for the following:

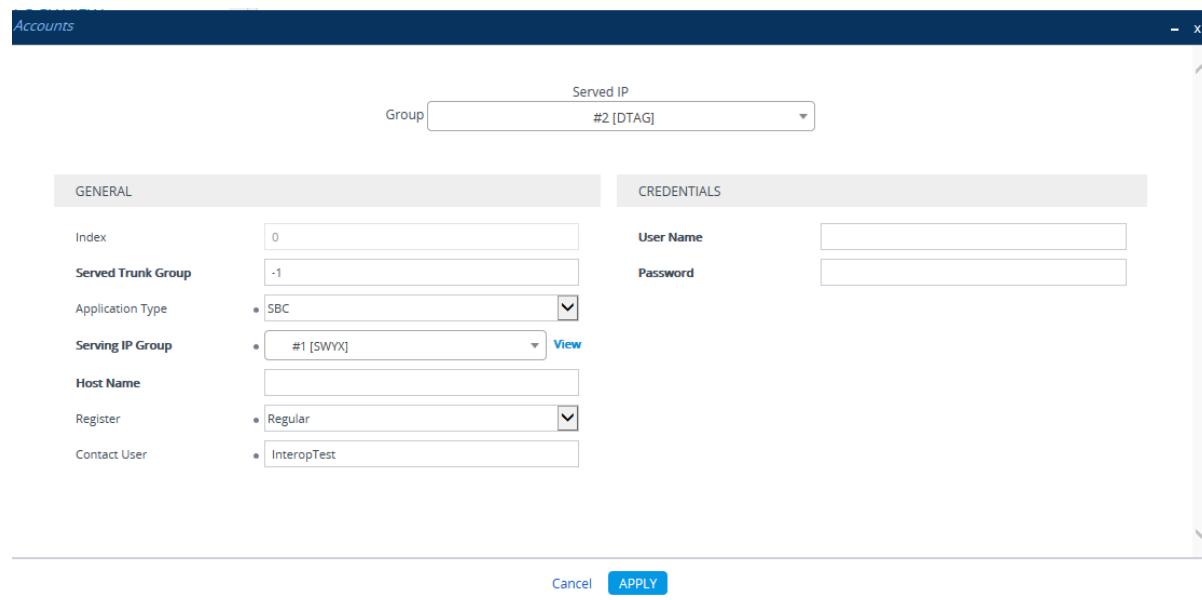

- DTAG SIP Trunk. The DTAG SIP Trunk requires registration and authentication to provide service.
- SWYX IP-PBX. The SwyxWare 2015 Lancom-VD Trunk Group requires registration in order to activate it.

➤ **To configure a registration accounts:**

1. Open the Account Table page (**Configuration** tab > **VoIP** menu > **SIP Definitions** > **Account Table**).
2. Create a new account according to the provided information from the SWYX, for example:

Parameter	Value
Served IP Group	2 (DTAG)
Application Type	SBC
Serving IP Group	1 (SWYX)
Register	Regular
Contact User	InteropTest (as configured in the SwyxWare Trunk)
Username	if configured in the SwyxWare Trunk
Password	if configured in the SwyxWare Trunk

Figure 4-26: Configuring a SIP Registration Account for SWYX

The screenshot shows the 'Accounts' configuration page. The 'GENERAL' tab is active, displaying the following settings:

- Served IP Group: #2 [DTAG]
- Index: 0
- Served Trunk Group: -1
- Application Type: SBC
- Serving IP Group: #1 [SWYX]
- Host Name: (empty)
- Register: Regular
- Contact User: InteropTest

The 'CREDENTIALS' tab is also visible but contains no data.

3. Create a new account according to the provided information from DTAG , for example:

Parameter	Value
Served IP Group	1 (SWYX)
Application Type	SBC
Serving IP Group	2 (DTAG)
Host Name	sip-trunk.telekom.de
Register	GIN
Contact User	+496987409354 (trunk main line)
Username	as provided by DTAG
Password	as provided by DTAG

Figure 4-27: Configuring a SIP Registration Account for DTAG

The screenshot shows the 'Accounts' configuration page. At the top, there is a 'Served IP Group' dropdown set to '#1 [SWYX]'. Below this, the 'GENERAL' and 'CREDENTIALS' tabs are visible. Under 'GENERAL', fields include Index (1), Served Trunk Group (-1), Application Type (SBC), Serving IP Group (#2 [DTAG]), Host Name (sip-trunk.telekom.de), Register (GIN), and Contact User (+496987409354). Under 'CREDENTIALS', fields include User Name (AUDIOCODES-reg1) and Password (a masked password). At the bottom, there are 'Cancel' and 'APPLY' buttons.

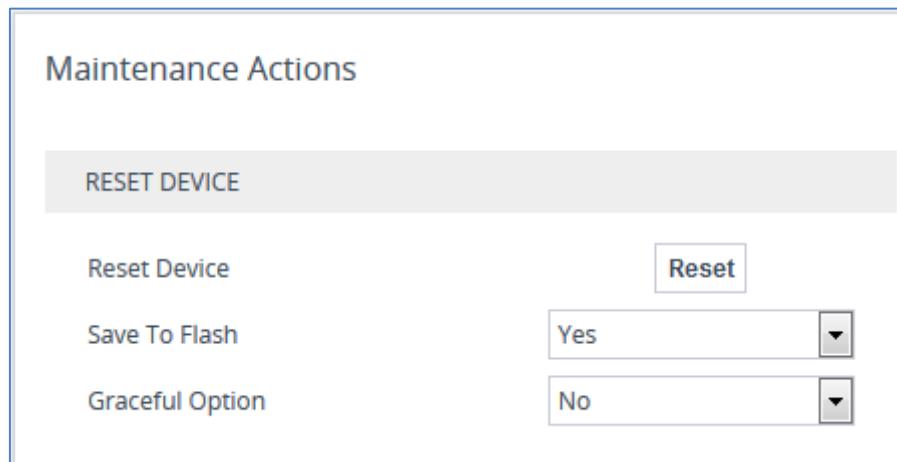

4.13 Step 13: Reset the E-SBC

After you have completed the configuration of the E-SBC described in this chapter, save ("burn") the configuration to the E-SBC's flash memory with a reset for the settings to take effect.

➤ **To reset the device through Web interface:**

1. Open the Maintenance Actions page (**Setup** menu > **Administration** tab > **Maintenance** folder > **Maintenance Actions**).

Figure 4-28: Resetting the E-SBC

2. Ensure that the 'Save To Flash' field is set to **Yes** (default).
3. Click the **Reset** button; a confirmation message box appears, requesting you to confirm.
4. Click **OK** to confirm device reset.

A AudioCodes INI File

The *ini* configuration file of the E-SBC, corresponding to the Web-based configuration as described in Section 4 on page 23, is shown below:

Note: To load or save an *ini* file, use the Configuration File page (**Setup** menu > **Administration** tab > **Maintenance** folder > **Configuration File**).
